Pesticides in the Atmosphere CRC Press
Data on water quality and other environmental
issues are being collected at an ever-increasing
rate. In the past, however, the techniques used
by scientists to interpret this data have not
progressed as quickly. This is a book of
modern statistical methods for analysis of
practical problems in water quality and water
resources. The last fifteen years have seen major
advances in the fields of exploratory data
analysis (EDA) and robust statistical methods.
The 'real-life' characteristics of environmental
data tend to drive analysis towards the use of
these methods. These advances are presented in

a practical and relevant format. Alternate methods are compared, highlighting the strengths and weaknesses of each as applied to environmental data. Techniques for trend analysis and dealing with water below the detection limit are topics covered, which are of great interest to consultants in water-quality and hydrology, scientists in state, provincial and federal water resources, and geological survey agencies. The practising water resources scientist will find the worked examples using actual field data from case studies of environmental problems, of real value. Exercises at the end of each chapter enable the mechanics of the methodological process to be fully understood, with data sets included on diskette for easy use. The result is a book that is both up-to-date and immediately relevant to ongoing work in the environmental and water

sciences.

Fish kills are graphic evidence of serious problems in a lake or stream. If the kill is related to the presence of toxic chemicals, there may be human health concerns, in addition to the obvious damage to the ecosystem and the fisheries resources. Depending on the cause of a fish kill, legal and economic ramifications may be involved. If the kill is caused by human or corporate actions, litigation

is likely to follow, with possible court-awarded damages and assessed costs for cleanup and restoration. This manual is intended to help fisheries biologists and others to prepare for a fish kill investigation.

The need for current and better quality training materials was cited by both certification program instructors and coordinators. In recognition of these shortcomings, the U. S. Department of Agriculture (USDA) funded a major project with Penn State University, The Ohio State University, and the National Safety Council to develop a National Safe Tractor and

Machinery Operation Program (NSTMOP). The result is the NSTMOP Student Manual. This manual, including the task sheets, is the primary curriculum resource developed and designed to be used in a variety of instructional settings. The task sheets are divided into 6 sections: introduction; safety basics; agricultural hazards; the tractor; connecting and using implements with the tractor; and material handling (skid steers, ATV, and utility vehicles). There are a total of 77 task sheets, 48 are identified as core topics. Also included are a skills and driving test layout map and evaluation forms.

Sediment contamination is a widespread

environmental problem that can potentially pose a threat to a variety of aquatic ecosystems. The sediment test methods in this manual will be used by The United States Environmental Protection Agency (USEPA) to make decisions under a range of statutory authorities concerning such issues as: dredged material disposal, registration of pesticides and toxic substances, superfund site assessment, and assessment and cleanup of hazardous waste treatment, storage, and disposal facilities. The use of uniform sediment testing procedures by USEPA programs is expected to increase data accuracy and precision, facilitate test replication, increase the comparative value of test results, and ultimately, increase the efficiency of regulatory processes requiring sediment tests.

Oehlert's text is suitable for either a service course for non-statistics graduate students or for statistics majors. Unlike most texts for the one-term grad/upper level course on experimental design, Oehlert's new book offers a superb balance of both analysis and design, presenting three practical themes to students:

- when to use various designs
- how to analyze the results
- how to recognize various design

options Also, unlike other older texts, the book is fully oriented toward the use of statistical software in analyzing experiments.

Understanding Pathophysiology Natural Resource Agriculture and Engineering Service (Nraes)

The acclaimed novel of love, ambition, and Arctic adventure "told with fin de siècle elegance" —with an introduction by Philip Pullman (Kirkus Reviews). It is July 1897, at the northernmost reach of the inhabited world. Swedish inventor Gustav Crispin is determined to become the first person to set foot on the North Pole, and return, borne by hot air balloon. Making the expedition

with two companions—an American journalist and a young, French-speaking adventurer—all three climb into the small wicker gondola and cuts the ropes. But as Gustav pursues his history-making ambition, and their flimsy balloon is battered by Arctic winds, his mind returns again and again to his fraught romance with the beautiful Luisa. Nominated for the National Book Award in 1977, *The Balloonist* was hailed by Mary Renault as a “tour de force.” The story of Gustav Crispin is “chilling and comic by turn . . . An unusual mixture of Arctic adventure and Parisian love story with philosophic overtones” (Kirkus Reviews).

"In May 2009, the Government of Canada, through the Pest Management Regulatory Agency (PMRA) of Health Canada, asked the Council of Canadian Academies to appoint an expert panel to answer the question, "What is the scientific status of the use of integrated testing strategies in the human and environmental regulatory risk assessment of pesticides?" The charge to the Panel was further specified in a series of sub-questions: [1]

What is the state of the science of the tools and data sources associated with integrated testing strategies? [2] What is the current status of the use of integrated testing strategies for the risk assessment of pesticides, pharmaceuticals, industrial chemicals, and other chemical substances by regulatory agencies around the world? [3] Could there be potential impacts on the public's perception and confidence in regulatory risk assessment and risk management decisions for pesticides if integrated testing strategies were implemented?"--P. xiii-xiv. The Toxic Substances Control Act

Most people know about the presence and health effects of pesticide residues in the water they drink. However, they may not realize the impact of atmospheric transportation and deposition of pesticides on water quality. Scientific studies of pesticides in various atmospheric matrices

(air, rain, snow, aerosols, and fog) provide some of the answers.
