This text is designed to provide instructors with a convenient single text resource for bridging between general and algebraic topology courses. Two separate, distinct sections (one on general, point set topology, the other on algebraic topology) are each suitable for a one-semester course and are based around the same set of basic, core topics.

2 Ex. 13.7 (Morten Poulsen). We know that  $T_1$  and  $T_2$  are bases for topologies on  $R$ . Further-more  $T_3$  is a topology on  $R$ . It is straightforward to check that the last two sets are bases for topologies on  $R$  as well.

Munkres also does the Smirnov Metrization Theorem which relies more on paracompactness. But Kelley does Moore-Smith convergence and nets-a way of doing topology with sequences, and only gives a reference for Smirnov. The Munkres text gave a brief introduction to homotopy and the fundamental group-Kelley none.

Algebraic topology is a tough subject to teach, and this book does a very good job. Some prerequisites, however, are essential: \* point set topology (e.g. in Munkres' Topology) \* Abstract algebra \* Mathematical maturity to be willing to follow a definition and argument even when it seems like a weird side-track

Topology by James Munkres, 2nd Edition Solutions Manual. The main solutions manual is solutions.tex. Some solutions have figures, which are done directly in LaTeX using the TikZ and PGFPLLOTS packages. The python directory contains some quick and dirty Python scripts that were used to gain insight while working on some of the exercises. These are not documented at all and so probably will not be of interest to anyone else.
