Reducing carbon dioxide (CO₂) emissions is imperative to stabilizing our future climate. Our ability to reduce these emissions combined with an understanding of how much fossil-fuel-derived CO₂ the oceans and plants can absorb is central to mitigating climate change. In *The Carbon Cycle*, leading scientists examine how atmospheric carbon dioxide concentrations have changed in the past and how this may affect the concentrations in the future. They look at the carbon budget and the "missing sink" for carbon dioxide. They offer approaches to modeling the carbon cycle, providing mathematical tools for predicting future levels of carbon dioxide. This comprehensive text incorporates findings from the recent IPCC reports. New insights, and a convergence of ideas and views across several

disciplines make this book an important contribution to the global change literature.

Mathematics was only one area of interest for Gerolamo Cardano ? the sixteenth-century astrologer, philosopher, and physician was also a prolific author and inveterate gambler. Gambling led Cardano to the study of probability, and he was the first writer to recognize that random events are governed by mathematical laws.

Published posthumously in 1663, Cardano's *Liber de ludo aleae* (Book on Games of Chance) is often considered the major starting point of the study of mathematical probability.

The Italian scholar formulated some of the field's basic ideas more than a century before the better-known correspondence of Pascal and Fermat.

Although his book had no direct influence on other early thinkers about probability, it remains an important antecedent to later expressions of the science's tenets.
