An updated and expanded edition of the international bestseller Most of us have no idea

what's really going on inside our heads. Yet brain scientists have uncovered details that every business leader, parent, and teacher should know — for instance, that physical activity helps to get your brain working at its best. How do we learn? What do sleep and stress do to our brains? Why is multitasking a myth? Why is it so easy to forget — and so important to repeat new information? In Brain Rules, Dr John Medina, a molecular biologist, shares his lifelong interest in brain science, and how it can influence the way we teach our children and the way we work. In each chapter, he describes a brain rule — what scientists know for sure about how our brains work — and offers transformative ideas for our daily lives. In this expanded edition — which includes additional information on the brain rules and a new chapter on music — you will discover how every brain is wired differently, why memories are volatile, and how

stress and sleep can influence learning. By the end, you'll understand how your brain really works — and how to get the most out of it.

A definitive guide to the depth and breadth of the ecological sciences, revised and updated  
The revised and updated fifth edition of Ecology: From Individuals to Ecosystems – now in full colour – offers students and practitioners a review of the ecological sciences. The previous editions of this book earned the authors the prestigious 'Exceptional Life-time Achievement Award' of the British Ecological Society – the aim for the fifth edition is not only to maintain standards but indeed to enhance its coverage of Ecology. In the first edition, 34 years ago, it seemed acceptable for ecologists to hold a comfortable, objective, not to say aloof position, from which the ecological communities around us were simply material for which we sought a scientific understanding. Now,

we must accept the immediacy of the many environmental problems that threaten us and the responsibility of ecologists to play their full part in addressing these problems. This fifth edition addresses this challenge, with several chapters devoted entirely to applied topics, and examples of how ecological principles have been applied to problems facing us highlighted throughout the remaining nineteen chapters. Nonetheless, the authors remain wedded to the belief that environmental action can only ever be as sound as the ecological principles on which it is based. Hence, while trying harder than ever to help improve preparedness for addressing the environmental problems of the years ahead, the book remains, in its essence, an exposition of the science of ecology. This new edition incorporates the results from more than a thousand recent studies into a

fully up-to-date text. Written for students of ecology, researchers and practitioners, the fifth edition of *Ecology: From Individuals to Ecosystems* is an essential reference to all aspects of ecology and addresses environmental problems of the future.

Giant sauropod dinosaur skeletons from Patagonia; dinosaurs with feathers from China; a tiny dinosaur tail in Burmese amber complete down to every detail of its filament-like feathers, skin, bones and mummified muscles. Dinosaurs continue to regularly cause a media sensation. Remarkable new fossil finds are the lifeblood of modern palaeobiology, but it is the advances in technologies and methods that have allowed the revolution in the scope and

confidence of the field. Over the past twenty years, the study of dinosaurs has become a true scientific discipline. New technologies have revealed secrets locked in the prehistoric bones in ways that nobody predicted we can now work out the colour of dinosaurs, their bite forces, top speeds and even how they cared for their young. *The Dinosaurs Rediscovered* gathers together all the latest palaeontological evidence and takes us behind the scenes on expeditions and in museum laboratories, tracing the transformation of dinosaur study from its roots in antiquated natural history to a highly technical, computational and indisputably scientific field today. Michael J. Benton explores what we know of the world of the dinosaurs, how dinosaur remains are found

and excavated, and how palaeontologists read the details of the lives of dinosaurs from fossils their colours, their growth, feeding and locomotion, how they grew from egg to adult, how they sensed the world, and even whether we will ever be able to bring them back to life. Dinosaurs are still very much a part of our world.
