Despite tremendous gains in medical knowledge, most conditions are managed, rather than cured, by medications. As a result, countless patients seek supplemental modes of care to better control their symptoms and conditions to improve their overall wellbeing. This reality spotlights the need for adjuvant medical procedures. Adjuvant medical care refers to any supportive therapy that enhances the outcome of medical measures already in place. Adjuvant care does not replace primary or traditional treatments, but instead serves as add-on care to the initial medical treatment plan prescribed by a health care provider. The addition of one or more non-prescription therapies (e.g., nutritional support, over-the-counter remedies, home care, dietary measures, supplements, etc.) to the primary medical management regimen has become increasingly popular and mainstream thanks to scientific studies that have documented favorable outcomes for many patients. The verifiable scientific merit of these additional medical options demonstrates their usefulness in the treatment of many medical conditions. The purpose of this handbook is to provide support to doctors and patients who are interested in safe and effective non-prescription and non-pharmacological medical therapies for specific conditions to minimize symptoms and optimize recovery and quality of life. • Helps doctors and patients discover additional therapies that can reduce pain, advance health outcomes, minimize complications and disability, and extend life. • Presents safe, reliable, and practical options that are available to reduce symptoms, maximize recovery, and positively augment the management of a variety of conditions. • Provides medical insight into less traditional, yet often effective, supportive options for enhancing and optimizing patient response to care. This book is a valuable resource for both doctors and patients who are committed to achieving the best possible medical outcomes through a variety of coordinated approaches.

Pharmacology. International Edition Lippincott Williams & Wilkins

This book is the 4th in a series of Acute Care books written with the aim to address the NEEDS of health care providers when handling the acutely ill patients. Globally it has become apparent that the study of pharmacology and subsequent clinical training has not always adequately equipped young doctors with the ability to administer drugs to their patients safely and confidently, particularly in the critically ill patient. Compounding this issue is the lack of resource material related to these pharmacological concepts contained in one book that can help health care providers to understand and manage drug therapy in the acute situation. In spite of progressively newer and more developed protocols, guidelines, algorithms and many other books addressing the technical aspects of what needs to be done, most health care providers still find it difficult to grasp the basic pharmacological knowledge and rationally deliver the CARE that is required in the acute phase of patient management. The editors/authors have therefore aimed for a book that highlights topics and pharmacological issues pertinent to management of patients in their hour of need. This is a multi-author book but the style has been guided by 3 editors. The editors have used a different perspective - that of normalizing abnormal physiological processes with pharmacological agents - to address the GAPS in a bedside to bench

approach. The details are pared down but important principles/concepts are emphasized.
