The book . . . is an excellent resource to deal with the attack on evolution, which is a surrogate, and indeed a wedge, for a wide-ranging crusade against the scientific integrity of the public education system in America."--Rev. Barry W. Lynn from the Foreword More than eighty years after the Scopes trial, creationism is alive and well. Through local school boards, sympathetic politicians, and well-funded organizations, a strong movement has developed to encourage the teaching of the latest incarnation of creationism—intelligent design—as a scientifically credible theory alongside evolution in science classes. Although intelligent design suffered a serious defeat in the recent Kitzmiller v. Dover trial, its proponents are bound to continue their assault on evolution education. Now, in *Not in Our Classrooms*, parents and teachers, as well as other concerned citizens, have a much-needed tool to use in the argument against teaching intelligent design as science. Where did the concept of intelligent design originate? How does it connect with, and conflict with, various religious beliefs? Should we teach the controversy itself in our science classrooms? In clear and lively essays, a team of experts answers these questions and many more, describing the history of the intelligent design movement and the lack of scientific support for its claims. Most importantly, the contributors—authorities on the scientific, legal, educational, and theological problems of intelligent design—speak specifically to teachers and parents about the need to defend the integrity of science education by keeping intelligent design out of science curriculums. A concluding chapter offers concrete advice for those seeking to defend the teaching of evolution in their own communities. *Not in Our Classrooms* is essential reading for anyone concerned about defending the teaching of evolution, uncompromised by religiously motivated pseudoscience, in the classrooms of our public schools.

Cytogenetics plays an important role in understanding the chromosomal and genetic architecture of plant species. *Plant Cytogenetics, Third Edition* follows the tradition of its predecessors presenting theoretical and practical aspects of plant cytogenetics. Chapters describe correct handling of plant chromosomes, methods in plant cytogenetics, cell division, reproduction methods, chromosome nomenclature, karyotype analysis, chromosomal aberrations, genome analysis,

transgenic crops, and cytogenetics in plant breeding. This new edition begins with a brief introduction on the historical aspect of cytogenetics and flows directly into handling of plant chromosomes by classical and modern cytological techniques, classical Mendelian Genetics, brief description of cell division, and chromosome identification by karyotype analysis. The comprehension of cytogenetics is incomplete without information on the role of aneuploidy in associating a gene on a particular chromosome, and the book covers these methodologies as a primary topic. Covering classical to modern cytogenetics, the book presents to the reader the crucial role of cytogenetics in improving crops.

*Chromosome Identification—Technique and Applications in Biology and Medicine* contains the proceedings of the Twenty-Third Nobel Symposium held at the Royal Swedish Academy of Sciences in Stockholm, Sweden, on September 25-27, 1972. The papers review advances in chromosome banding techniques and their applications in biology and medicine. Techniques for the study of pattern constancy and for rapid karyotype analysis are discussed, along with cytological procedures; karyotypes in different organisms; somatic cell hybridization; and chemical composition of chromosomes. This book is comprised of 51 chapters divided into nine sections and begins with a survey of the cytological procedures, including fluorescence banding techniques, constitutive heterochromatin (C-band) technique, and Giemsa banding technique. The following chapters explore computerized statistical analysis of banding pattern; the use of distribution functions to describe integrated profiles of human chromosomes; the uniqueness of the human karyotype; and the application of somatic cell hybridization to the study of gene linkage and complementation. The mechanisms for certain chromosome aberration are also analyzed, together with fluorescent banding agents and differential staining of human chromosomes after oxidation treatment. This monograph will be of interest to practitioners in the fields of biology and medicine.
