The precipitation and deposition of solids are a major challenge in the production of oil and gas. Flow assurance solids are formed because of unavoidable changes in temperature, pressure and composition of the oil-gas-water flowstream, from reservoir conditions to processing conditions. The advent of subsea production and the increased exploitation of heavy crudes have made flow assurance issues dominant in ensuring efficient and safe exploitation of hydrocarbon assets. Five troublesome flow assurance solids are described in the

book: asphaltene, paraffin wax, natural gas hydrate, naphthenate and inorganic scale. These big-five solids are presented in stand-alone chapters. Each chapter is designed to be readable without clutter. Derivations of equations and descriptions of supporting details are given in several appendices. The book is intended for professional engineers and natural scientist working in E&P companies, engineering companies, service companies and specialized companies. An understanding of the big-five solids is required throughout the lifetime of oil and gas assets, from early development to abandonment. The technical, safety and environmental risks associated with deposition problems in near-wellbore formations, production tubing, wellhead equipment, flowlines and processing facilities, are relevant for decisions in the oil and gas industry and in outside regulatory and financial entities.

The National Bureau of Standards Boulder Laboratories at Boulder, Colorado once again served as the host for the 1972 Cryogenic Engineering Conference. For the

Cryogenic Engineering Conference it was like coming home, for it was at the NBS Boulder Laboratories that the Cryogenic Engineering Conference was first conceived and held in 1954 in connection with the dedication of the NBS Boulder Laboratories by President Dwight D. Eisenhower. The Cryogenic Engineering Conference is grateful for the continuing support that the National Bureau of Standards has given over the years, and which was expanded on July 1, 1971 when the NBS Boulder Laboratories assumed the secretariat function of the Conference from the National Academy of Sciences. Because of common interests in heat transfer, the 1972 Cryogenic Engineering Conference worked with the 13th National Heat Transfer Conference to develop a joint program in heat transfer. A majority of the papers presented in this cooperative effort are included in Volume 18 of the Advances in Cryogenic Engineering through the kind permission of the 13th National Heat Transfer Conference and are acknowledged accordingly.
