Much research has attempted to show direct linear relations between genes and disorder. However, scientists have been discouraged by inconsistent findings based on this simple gene-phenotype approach. The alternative approach is to incorporate information about the environment. A gene-environment interaction approach assumes that environmental pathogens cause disorder, whereas genes influence susceptibility to environmental pathogens. This book brings together contributions from experts from multiple disciplines who discuss: How epidemiological cohort studies can better integrate physiological (mechanistic) measures; How best to characterise subjects' vulnerability versus resilience by moving beyond single genetic polymorphisms; How gene hunters can benefit from recruiting samples selected for known exposures; How environmental pathogens can be used as tools for gene hunting; How to deal with potential spurious (statistical) interactions, and How genes can help explain fundamental demographic properties of disorders (e.g. sex distribution, age effects).

The beginning of the 19th century saw the rise of a remarkable Sikh leader in the Punjab province of north-west India. Unifying the feudal rulers under his authority, the conquering Maharaja Ranjit Singh pursued campaigns of expansion for nearly 40 years, creating for the purpose a new regular army on the Western model. His death in 1839 found the frontiers of Sikh and British power in confrontation; in the 1840s the inevitable trial of strength brought British crown and East India Company troops into battle against the most formidable Indian army they ever faced. Its story is told here in fascinating detail, illustrated with rare early paintings and with colourful reconstructions of Punjabi regular soldiers and feudal warriors.
