Music-Dance explores the identity of choreomusical work, its complex authorship and its modes of reception as well as the cognitive processes involved in the reception of dance performance. Scholars of dance and music analyse the ways in which a musical score changes its prescriptive

status when it becomes part of a choreographic project, the encounter between sound and motion on stage, and the intersection of listening and seeing. As well as being of interest to musicologists and choreologists considering issues such as notation, multimedia and the analysis of performance, this volume will appeal to scholars interested in applied research in the fields of cognition and neuroscience. The line-up of authors comprises representative figures of today ' s choreomusicology, dance historians, scholars of twentieth-century composition and specialists in cognitive science and performance studies. Among the topics covered are multimedia and the analysis of

performance; the notational practice of choreographers and the parallel attempts of composers to find a graphic representation for musical gestures; and the experience of dance as a paradigm for a multimodal perception, which is investigated in terms of how the association of sound and movement triggers emotions and specific forms of cognition.

The first philosophical monograph on the ethics of memory manipulation (MM), "Forget Me Not: The Neuroethical Case Against Memory Manipulation" contends that any attempt to directly and intentionally erase episodic memories poses a grave threat to

the human condition that cannot be justified within a normative moral calculus. Grounding its thesis in four evidential effects - namely, (i) MM disintegrates autobiographical memory, (ii) the disintegration of autobiographical memory degenerates emotional rationality, (iii) the degeneration of emotional rationality decays narrative identity, and (iv) the decay of narrative identity disables one to seek, identify, and act on the good - DePergola argues that MM cannot be justified as a morally licit practice insofar as it disables one to seek, identify, and act on the good. A landmark achievement in the field of neuroethics, this book is a welcome addition to both the scholarly and professional community in philosophical and clinical bioethics.

In *By Parallel Reasoning* Paul Bartha proposes a normative theory of analogical arguments and raises questions and proposes answers regarding (i.) criteria for

evaluating analogical arguments, (ii.) the philosophical justification for analogical reasoning, and (iii.) the place of scientific analogies in the context of theoretical confirmation.

In a world of global communication, where each one's life depends increasingly on signs, language and communication, understanding how we relate and opening ourselves to otherness, to differences in all their forms and aspects is becoming more and more relevant. Today, we often understand the differences in terms of adversity or opposition and forget the value of the similarities. Semiotic approaches can provide a critical point of view and a more general reflection that can redefine some aspects of the discussion about the nature of these semiotic categories, differences and similarities. The dichotomy differences – similarities is fundamental to understanding the meaning-making mechanisms in language (De Saussure, 1966; Deleuze, 1995), as well as in other sign systems (Ponzio, 1995; Sebeok & Danesi, 2000). Meaning always appears in the “play of differences” (Derrida, 1978) and similarities. Therefore, the phenomena of similarities and differences must be considered complementary (Marcus, 2011). This book

addresses and offers new perspectives for analyzing and understanding sensitive topics in the world of global communication (humanities education, responsive understanding of otherness, digital culture and new media power).

Causal reasoning is one of our most central cognitive competencies, enabling us to adapt to our world. Causal knowledge allows us to predict future events, or diagnose the causes of observed facts. We plan actions and solve problems using knowledge about cause-effect relations. Without our ability to discover and empirically test causal theories, we would not have made progress in various empirical sciences. The handbook brings together the

leading researchers in the field of causal reasoning and offers state-of-the-art presentations of theories and research. It provides introductions of competing theories of causal reasoning, and discusses its role in various cognitive functions and domains. The final section presents research from neighboring fields.

This book is the first to explore the varied ways in which invented languages can be used to teach languages and linguistics in university courses.

There has long been interest in invented languages, also known as constructed languages or conlangs, both in the political arena (as with Esperanto) and in the world of literature and science fiction and fantasy media - Tolkien's Quenya and Sindarin, Dothraki in Game of Thrones, and Klingon in the Star Trek franchise, among many others. Linguists have recently served as language creators or consultants for film and television, with notable examples including Jessica Coon's work on the film Arrival Christine Schreyer's Kryptonian for Man of Steel, David Adger's contributions to the series

Beowulf, and David J. Peterson's numerous languages for Game of Thrones and other franchises. The chapters in this volume show how the use of invented languages as a teaching tool can reach a student population who might not otherwise be interested in studying linguistics, as well as helping those students to develop the fundamental core skills of linguistic analysis. Invented languages encourage problem-based and active learning; they shed light on the nature of linguistic diversity and implicational universals; and they provide insights into the complex interplay of linguistic patterns and social, environmental, and historical processes. The volume brings together renowned scholars and junior researchers who have used language invention and constructed languages to achieve a range of pedagogical objectives. It will be of interest to graduate students and teachers of linguistics and those in related areas such as anthropology and psychology.

Our understanding of human rationality has changed significantly since the beginning of the century, with growing emphasis being placed on multiple rationalities, each adapted to the specific tasks of communities of practice. We may think of the world as an ontological unity-but we use a plurality of methods to investigate and represent this world. This development has called into question both the appeal

to a universal rationality, characteristic of the Enlightenment, and also the simple 'modern-postmodern' binary. The Territories of Human Reason is the first major study to explore the emergence of multiple situated rationalities. It focuses on the relation of the natural sciences and Christian theology, but its approach can easily be extended to other disciplines. It provides a robust intellectual framework for discussion of transdisciplinarity, which has become a major theme in many parts of the academic world. Alister E. McGrath offers a major reappraisal of what it means to be 'rational' which will have significant impact on older discussions of this theme. He sets out to explore the consequences of the seemingly inexorable move away from the notion of a single universal rationality towards a plurality of cultural and domain-specific methodologies and rationalities. What does this mean for the natural sciences? For the philosophy of science? For Christian theology? And for the interdisciplinary field of science and religion? How can a single individual hold together scientific and religious ideas, when these arise from quite different rational approaches? This groundbreaking volume sets out to engage these questions and will provoke intense discussion and debate.

More than any other psychology textbook, Don and Sandra Hockenbury's Psychology relates the science of psychology to the lives of the wide range of students taking the introductory course. Now Psychology returns in a remarkable new edition that shows just how well-attuned the Hockenburys are to

the needs of today ' s students and instructors. Psychology began with a basic idea: combine scientific authority with a narrative that engages students and relates to their lives. From decades of experience teaching, the Hockenburys created a book filled with cutting-edge science and real-life stories that draw students of all kinds into the course. **Thinking Like a Lawyer** Vernon Press
Similarity and analogy are fundamental in human cognition. They are crucial for recognition and classification, and have been associated with scientific discovery and creativity. Any adequate understanding of similarity and analogy requires the integration of theory and data from diverse domains. This interdisciplinary volume explores current development in research and theory from psychological, computational, and educational perspectives, and considers their implications for learning and instruction. The distinguished contributors examine the psychological processes involved in reasoning by similarity and analogy, the computational problems encountered in simulating analogical processing in problem solving, and the conditions promoting the application of analogical reasoning in everyday situations. **Language Invention in Linguistics Pedagogy**

This volume presents authoritative and up-to-date research in colour studies by specialists across a wide range of academic disciplines, including vision science, psychology, psycholinguistics, linguistics, anthropology, onomastics, philosophy, archaeology and design. The chapters have been developed from papers and posters presented at the Progress in Colour Studies (PICS2016) conference held at University College London in September 2016. The book continues the series from the earlier PICS conferences, which have become renowned for their insights into colour in language and cognition. In the present book all chapters have been rigorously peer-reviewed and revised to ensure the highest standards throughout. The chapters are grouped into three sections: Colour Perception and Cognition; The Language of Colour; and The Diversity of Colour. Each section is preceded by a short introduction drawing together the themes of its chapters. There are over 120 colour illustrations. **Similarity and Analogical Reasoning** Oxford University Press, USA

This book rehabilitates beta as a definition of systemic risk by using particle physics to evaluate discrete components of financial risk. Much of the frustration with beta stems

from the failure to disaggregate its discrete components; conventional beta is often treated as if it were "atomic" in the original Greek sense: uncut and indivisible. By analogy to the Standard Model of particle physics theory's three generations of matter and the three-way interaction of quarks, Chen divides beta as the fundamental unit of systemic financial risk into three matching pairs of "baryonic" components. The resulting econophysics of beta explains no fewer than three of the most significant anomalies and puzzles in mathematical finance. Moreover, the model's three-way analysis of systemic risk connects the mechanics of mathematical finance with phenomena usually attributed to behavioral influences on capital markets. Adding consideration of volatility and correlation, and of the distinct cash flow and discount rate components of systematic risk, harmonizes mathematical finance with labor markets, human capital, and macroeconomics.

“ I don't know when I've been so wowed by a new author ” – Chip Health, co-author of *The Power of Moments* and *Switch* A talented

journalist reveals the hidden patterns behind what we call "luck" -- and shows us how we can all improve outcomes despite life's inevitable randomness. "Do you believe in luck?" is a polarizing question, one you might ask on a first date. Some of us believe that we make our own luck. Others see inequality everywhere and think that everyone's fate is at the whim of the cosmos. Karla Starr has a third answer: unlucky, "random" outcomes have predictable effects on our behavior that often make us act in self-defeating ways without even realizing it. In this groundbreaking book, Starr traces wealth, health, and happiness back to subconscious neurological processes, blind cultural assumptions, and tiny details you're in the habit of overlooking. Each chapter reveals how we can cultivate personal strengths to overcome life's unlucky patterns. For instance:

- Everyone has free access to that magic productivity app—motivation. The problem? It isn't evenly distributed. What lucky accidents of history explain patterns behind why certain groups of people are more motivated in some situations than others?
- If you look like an underperforming employee, your resume can't override the gut-level assumptions that a potential boss will make from your LinkedIn photo. How can we make sure that someone's first impression is favorable?
- Just as people use irrelevant traits to make assumptions about your

intelligence, kindness, and trustworthiness, we also make inaccurate snap judgments. How do these judgments affect our interactions, and what should we assume about others to maximize our odds of having lucky encounters? We don't always realize when the world's invisible biases work to our advantage or recognize how much of a role we play in our own lack of luck. By ending the guessing game about how luck works, Starr allows you to improve your fortunes while expending minimal effort.

Over the last several decades, neuroscientists, cognitive psychologists, and psycholinguists have investigated the implicit and explicit continuum in language development and use from theoretical, empirical, and methodological perspectives. This book addresses these perspectives in an effort to build connections among them and to draw pedagogical implications when possible. The volume includes an examination of the psychological and neurological processes of implicit and explicit learning, what aspects of language learning can be affected by explicit learning, and the effects of bilingualism on the mental processing of language. Rigorous empirical research investigations probe

specific aspects of acquiring morphosyntax and phonology, including early input, production, feedback, age, and study abroad. A final section explores the rich insights provided into language processing by bilingualism, including such major areas as aging, third language acquisition, and language separation.
