This book combines work from curators, digital artists, human computer interaction researchers and computer scientists to examine the mutual benefits and challenges posed when working together to support digital art works in their many forms. In Curating the Digital we explore how we can work together to make space for art and interaction. We look at the various challenges such as the dynamic nature of our media, the problems posed in preserving digital art works and the thorny problems of how we assess and measure audience ' s reactions to interactive digital work. Curating the Digital is an outcome of a multi-disciplinary workshop that took place at SICHI2014 in Toronto. The participants from the workshop reflected on the theme of Curating the Digital via a series of presentations and rapid prototyping exercises to develop a catalogue for the future digital art gallery. The results produce a variety of insights both around the theory and philosophy of curating digital works, and also around the practical and technical possibilities and challenges. We present these complimentary chapters so that other researchers and practitioners in related fields will find motivation and imagination for their own work.

The book comprises of different areas in which vortex dynamics is important, its generation, evolution, interactions with other motions, and finally the ways it can be controlled. Vortex characteristics are important in many aspects of our lives, from blood circulation in the arteries to the high-speed jet. Flow control and manipulation of vortices have been used to reduce drag for large tankers resulting in billions of dollars in savings. An effective smoke management system must be put in place for critical areas to ensure the safety of people, for example in a very large shopping complex or a large airport. Advanced computational and cloud-computing facilities have contributed significantly to large-scale simulation projects.

Therefore, validations could be performed for larger windows of study so that it can now cover the entire e.g. central business district (CBD) for urban heat island (UHI) study or land-ocean interactions.

This book reflects the move in Human Computer Interaction studies from standard usability concerns towards a wider set of problems to do with fun, enjoyment, aesthetics and the experience of use. Traditionally HCI has been concerned with work and task based applications but as digital technologies proliferate in the home fun becomes an important issue. There is an established body of knowledge and a range of techniques and methods for making products and interfaces usable, but far less is known about how to make them enjoyable. Perhaps in the future there will be a body of knowledge and a set of techniques for assessing the pleasure of interaction that will be as thorough as those that currently assess usability. This book is a first step towards that. It brings together a range of researchers from academia and industry to provide answers. Contributors include Alan Dix, Jacob Nielsen and Mary Beth Rosson as well as a number of other researchers from academia and industry.
