Economic analysis rarely appears on the judicial horizon in intellectual property litigation. In competition cases, by contrast, economists are familiar figures in the courtroom and the language of economics is scattered throughout the judgments of even the highest courts. One might expect, therefore, that refusals to license intellectual property would generate the same fruitful symbiosis between law and economics when those refusals surface in competition proceedings. This however, has not been how the law on this subject has developed in most jurisdictions. Courts and enforcement agencies faced with a unilateral refusal to license have instead tended to retreat into sketchily articulated black letter rules and presumptions which then have to be fenced off from the rest of competition law by economically irrelevant qualifications and distinctions based on private law categorisations of, and rationales for, individual intellectual property rights. This bypassing of case-by-case analysis in favour of more traditional modes of legal reasoning is not entirely the fault of lawyers. Economists have contributed to this state of affairs by urging judges and regulators to convert empirically undernourished theories about the proper role of intellectual property in a market economy into rules of law and evidentiary presumptions intended to be binding in future cases. How this came about and what it means for the future of effective competition enforcement globally are the twin concerns of this book.

How is it that two broadly similar systems of competition law have reached different results across a number of significant antitrust issues? While the United States and the European Union share a commitment to maintaining competition in the marketplace and employ similar concepts and legal language in making antitrust decisions, differences in social values, political institutions, and legal precedent have inhibited close convergence. With *The Atlantic Divide in Antitrust*, Daniel J. Gifford and Robert T. Kudrle explore many of the main contested areas of contemporary antitrust, including mergers, price discrimination, predatory pricing, and intellectual property. After identifying how prevailing analyses differ across these areas, they then examine the policy ramifications. Several themes run throughout the book, including differences in the amount of discretion firms have in dealing with purchasers, the weight given to the welfare of various market participants, and whether competition tends to be viewed as an efficiency-generating process or as rivalry. The authors conclude with forecasts and suggestions for how greater compatibility might ultimately be attained.

In *Antitrust Law and Intellectual Property Rights: Cases and Materials*, Christopher R. Leslie describes how patents, copyrights, and trademarks confer exclusionary rights on their owners, and how firms sometimes exercise this exclusionary power in ways that exceed the legitimate bounds of their intellectual property rights. Leslie explains that while substantive intellectual property law defines the scope of the exclusionary rights, antitrust law often provides the most important consequences when owners of intellectual property misuse their rights in a way that harms consumers or illegitimately excludes competitors. Antitrust law defines the limits of what intellectual property owners can do with their IP rights. In this book, Leslie explores what conduct firms can and cannot engage in while acquiring and exploiting their intellectual property rights, and surveys those aspects of antitrust law that are necessary for both antitrust practitioners and intellectual property attorneys to understand. This book is ideal for an advanced antitrust course in a JD program. In addition to building on basic antitrust concepts, it fills in a gap that is often missing in basic antitrust courses yet critical for an intellectual property lawyer: the intersection of intellectual property and antitrust law. The relationship between intellectual property and antitrust is particularly valuable as an increasing number of law schools offer specializations and LL.M.s in intellectual property. This book also provides meaningful material for both undergraduate and graduate business schools programs because it explains how antitrust law limits the marshalling of intellectual property rights.

Digital airborne cameras are now penetrating the fields of photogrammetry and remote sensing. Due to the last decade's results in research and development in the fields of for instance detector technology, computing power, memory capacity position and orientation measurement it is now possible to generate with this new generation of airborne cameras different sets of geometric and spectral data with high geometric and radiometric resolutions within a single flight. This is a decisive advantage as compared to film based airborne cameras. The linear characteristic of the opto-electronic converters is the basis for the transition from an imaging camera to an images generating measuring instrument. Because of the direct digital processing chain from the airborne camera to the data products there is no need for the processes of chemical film development and digitising the film information. Failure sources as well as investments and staff costs are avoided. But the effective use of this new technology requires the knowledge of the features of the image and information generation, its possibilities and its restrictions. This book describes all components of a digital airborne camera from the object to be imaged to the mass memory device. So the image quality influencing processes in nature are described, as for instance the reflection of the electromagnetic sun spectrum at the objects to be imaged and the influence of the atmosphere. Also, the essential features of the new digital sensor system, their characteristics and parameters, are addressed and put into the system context. The complexity of the cooperation of all camera components, as for instance optics, filters, detector elements, analogue and digital electronics, software and so forth, becomes transparent. The book includes also the description of example systems.

Consumers can make choices because of the differentiation that is preserved by intellectual property. Competition law informs intellectual property, generally with the intent of ensuring that it achieves this main purpose. However, very often, certain public policies relating to competition interfere with the way intellectual property should normally operate, either with the purpose of reinforcing its differentiating role, or with the objective of submitting it to other public goals – such as access to essential goods and services, or in recognition of situations where a given invention becomes part of a technical standard or is deemed dangerous to health or the environment. This book presents eighty cases that interpret the various public policies that mould the interface of intellectual property law with competition law (or antitrust). Although most cases are from the United States - which has developed an enormously wide wealth of jurisprudence in this area - there are also cases from the European Union, the United Kingdom, Australia, Canada, South Africa, Brazil, South Korea, India, and Argentina. The author presents the cases under the following general headings: • setting the right dosage (i.e., avoiding too much or too little intellectual property); • setting the standards of differentiation; • refusing to license intellectual property; • licensing (and assigning) intellectual property; • enforcing intellectual property rights; • remedies; • intellectual property in sectors of special public interest; and • technical standards. Revealing in extraordinary depth the tensions behind the values of the free market which intellectual property serves and the variety of responses these tensions provoke, this book may be regarded as a watershed resource regarding the principles and

policies that, sometimes coherently, sometimes not, preside over the very complex relationship between intellectual property and antitrust. It is sure to be greatly valued by all professionals in both fields, from practitioners to policymakers, as well as by academics.

Imagine a high impact, low profile, nonpartisan government institution located across the street from the White House. Imagine that it plays a central role in shaping our technology industries, in overseeing globalization, and in holding the federal government responsible for its commercial activities. Imagine that only Congress and the Supreme Court can correct its mistakes. Such an institution exists. The United States Court of Appeals for the Federal Circuit was born in the early 1980s as part of the drive to liberalize and reinvigorate the American economy. Over the past twenty-five years, it has earned its nickname as the 'patent court' by revolutionizing American patent law, but it also oversees international trade law and government business law. Taken together, its docket covers the rules guiding innovation, globalization, and much of government. Are these rules impelling the economy forward or holding it back? Are the policies we have the policies we want? How are we faring, as the economy transitions from the industrial age to the information age? What responsibility does the Federal Circuit bear in shaping America's current economic policies in these three critical areas? The Secret Circuit demystifies this Court's work and answers these questions.

As intellectual property has grown in importance, the interaction between antitrust law and intellectual property has developed into a crucial part of the legal landscape. This new text is the first casebook expressly designed for a course on the intersection of intellectual property and antitrust law or for an advanced seminar on intellectual property misuse. It may also be suitable for supplemental use in a course on intellectual property, licensing, or litigation. Written by a professor who has worked in both the antitrust and intellectual property fields for over two decades, the casebook addresses both the rights of authors and inventors and the interest of society in promoting competition, expanding its base of knowledge, improving technology, and protecting consumer welfare.
