Digest of Japanese Industry & Technology Kodansha Amer Incorporated
The rise and relative decline of the Japanese economy has been an important feature of the world economy since the late 1980s. This book re-evaluates commonly held perceptions in the West and in Japan about the strength of the Japanese economy, shedding new light on Japan's current economic situation and prescribing policies to restructure the domestic economy in order to achieve growth objectives.

Customs Bulletin and Decisions Thomson South-Western
Written for the international investor gives pertinent information on the Japanese stock market and offers a forecast for a bull market through 1992.

Like many other new technologies which have since been seized and exploited by others, the industrial robot is a British invention. In 1957, a patent was produced by a British inventor, Cyril Walter Kenward, and later it became crucial to the future of robotics. For across the Atlantic two robot builders, Unimation and AMF, both infringed this patent and ultimately a cash settlement was made to Kenward. The owner of Unimation Inc. was Joseph Engelberger, an entrepreneur and avid reader of Isaac Asimov, the writer who helped to create the image of the benevolent robot. It is claimed that Engelberger's journey of fame down the road which led to him being hailed as the 'father of robotics' can be traced to the day that he met George C. Devol at a cocktail party. Devol was an inventor with an impressive list of patents to his name in the electronics field. One of Devol's patent applications referred to a Programmed Transfer Article. Devol's patent was issued in 1961 as US Patent 2,988,237, and this formed the basis of the Unimate robot which first saw the light of day in 1960. The first Unimate was sold to Ford Motor Company which used it to tend a die-casting machine. It is perhaps ironic that the first robot was used by a company which refused to recognise the machine as a robot, preferring instead to call it a Universal Transfer Device.

Financial measures have traditionally been the cornerstone of the performance measurement system. In recent years, there has been a shift from treating financial figures as the foundation for performance measurement to treating them as one among a broader set of potential financial measures. Changes in cost structures and the manufacturing and competitive environment have been responsible for the change of emphasis. In today's worldwide competitive environment companies are competing in terms of product quality, delivery, reliability, after-sales service and customer satisfaction. None of these variables are measured by traditional financial measures, despite the fact that they represent the major goals of world-class manufacturing companies. By focusing mainly on financial variables there is a danger that the performance reporting system will motivate managers to focus exclusively on cost reduction and short-term profitability and ignore many of the critical factors that determine long-term business success. The key to success, in today's global economy, is total customer satisfaction. To achieve this, companies must develop performance measures that drive employees to control processes that satisfy customer expectations. In particular, performance measures should provide process-level information that motivates employees to achieve the responsiveness and flexibility that companies require to compete on a global basis. Responsiveness is achieved by building relationships that lead to satisfied customers, suppliers and employees. Flexibility is achieved by reducing output variation in processes; for example, the reduction of lead times and delays are both necessary for sustained competitive excellence and long-term profitability.
