This textbook for a one-semester course in Digital Systems Design describes the basic methods used to develop "traditional" Digital Systems, based on the use of logic gates and flip flops, as well as more advanced techniques that enable the design of very large circuits, based on Hardware Description Languages and Synthesis tools. It was originally designed to accompany a MOOC (Massive Open Online Course) created at the Autonomous University of Barcelona (UAB), currently available on the Coursera platform. Readers will learn what a digital system is and how it can be developed, preparing them for steps toward other technical disciplines, such as Computer Architecture, Robotics, Bionics, Avionics and others. In particular, students will learn to design digital systems of medium complexity, describe digital systems using high level hardware description languages, and understand the operation of computers at their most basic level. All concepts introduced are reinforced by plentiful illustrations, examples, exercises, and applications. For example, as an applied example of the design techniques presented, the authors demonstrate the synthesis of a simple processor, leaving the student in a position to enter the world of Computer Architecture and Embedded Systems.

*Achtung-Panzer!* Springer Science & Business Media

This is one of the most significant military books of the twentieth century. By an outstanding soldier of independent mind, it pushed forward the evolution of land warfare and was directly responsible for German armoured supremacy in the early years of the Second World War. Published in 1937, the result of 15 years of careful study since his days on the German General Staff in the First World War, Guderian's book argued, quite clearly, how vital the proper use of tanks and supporting armoured vehicles would be in the conduct of a future war. When that war came, just two years later, he proved it, leading his Panzers with distinction in the Polish, French and Russian campaigns. Panzer warfare had come of age, exactly as he had forecast. This first English translation of Heinz Guderian's classic book - used as a textbook by Panzer officers in the war - has an introduction and extensive background notes by the modern English historian Paul Harris.

The articles in this book represent the major contributions at the NATO Advanced Research Workshop that was held from 6 to 9 July 1987 in the magnificent setting of Dyffryn House and Gardens, in St. Nicholas, just outside Cardiff, Wales. The idea for such a meeting arose in discussions that I had in 1985 and 1986 with many of the principal members of the various groups building prototype laser-interferometric gravitational wave detectors. It became clear that the proposals that these groups were planning to submit for large-scale detectors would have to address questions like the following:

- What computing hardware might be required to sift through data coming in at rates of several gigabytes per day for gravitational wave events that might last only a second or less and occur as rarely as once a month?
- What software would be required for this task, and how much effort would be required to write it?
- Given that every group accepted that a worldwide network of detectors operating in coincidence with one another was required in order to provide both convincing evidence of detections of gravitational waves and sufficient information to determine the amplitude and direction of the waves that had been detected, what sort of problems would the necessary data exchanges raise? Yet most of the effort in these groups had, quite naturally, been concentrated on the detector systems.

Unmanned Aircraft Systems delivers a much needed introduction to UAV System technology, taking an integrated approach that avoids compartmentalising the subject. Arranged in four sections, parts 1-3 examine the way in which various engineering disciplines affect the design, development and deployment of UAS. The fourth section assesses the future challenges and opportunities of UAS. Technological innovation and increasingly diverse applications are two key drivers of the rapid expansion of UAS technology. The global defence budget for UAS procurement is expanding, and in the future the market for civilian UAVs is expected to outmatch that of the military. Agriculture, meteorology, conservation and border control are just a few of the diverse areas in which UAVs are making a significant impact; the author addresses all of these applications, looking at the roles and technology behind both fixed wing and rotorcraft UAVs. Leading aeronautical consultant Reg Austin co-founded the Bristol International Remotely Piloted Vehicle (RPV) conferences in 1979, which are now the longest-established UAS conferences worldwide. In addition, Austin has over 40 years' experience in the design and development of UAS. One of Austin's programmes, the "Sprite UAV System" has been deployed around the world and operated by day and night, in all weathers.

'Governing power' is a pioneering attempt to examine the experience with independent regulation of electricity in India to assess its efficacy as an alternative form of governance. It compares the electricity experience with that of independent regulation in the other countries, independent regulatory bodies in India, and old-style regulation by government departments. It evaluates the Indian model in context of its replication over other sectors of the economy. S L Rao's experience of having operationalized the concept in India, as the first Chairman of the Central Electricity Regulatory Commission, provides valuable insights. This book epitomizes the multidisciplinary expertise (linking economics, management, financial and cost accounting, and engineering) that electricity regulatory commissions must harness to effectively regulate the sector, despite high government ownership, strong utility/government linkages, inefficiencies, and weak commercial attitudes. The book tracks the emergence of regulatory law from the orders of regulatory bodies and courts; explores the concept of 'independence' and discusses the accountability of independent regulators (an issue not sufficiently explored till now); and suggests directions for future development of independent regulation. Governing power is relevant to any environment where independent regulation is introduced, more so in developing economies or where government ownership is dominant. It is extremely relevant to utilities (private and public), regulators, courts, professional managers, accountants, and consultants. It will benefit anyone interested in enhancing the quality of governance.

*An Introduction to Finite Element Computations* Springer Science & Business Media

When he became a commercial pilot at age nineteen, Bill Grenier never imagined that one day he'd be captain of the largest commercial plane the world had seen, flying the highest profile routes of a proud national carrier. Even less could he have imagined, at age nineteen and with barely a penny to his name, that he'd one day be a wealthy man. But he would ultimately control an empire worth nearly a billion dollars. With liberal doses of wit and humour, Miles to Millions shows what a little luck, lots of perseverance, and an appetite for adventure can do. From boarding house to boardroom, from cradle to cockpit, Grenier offers a fascinating story of success both as a commercial pilot and as a businessman. Filled with anecdotes you'd never expect from a single career from acting as repo man taking planes for payment to saving hundreds of passengers in a stricken 747 with a collapsed co-pilot Miles to Millions is a high-flier of a story bound to entertain both aviation experts and enthusiasts alike.

1970 marked the seventh return of the Cryogenic Engineering Conference, now affiliated with the National Academy of Sciences through the Division of Engineering, National Research Council, to Boulder, Colorado. Local arrangements for this year's meeting have again been capably handled by the University of Colorado and the Cryogenics Division, NBS Institute for Basic Standards. The Cryogenic Engineering Conference Committee gratefully acknowledges the assistance of these two organizations, and particularly the Bureau of Continuation Education of the University of Colorado, for serving as hosts to the 1970 Cryogenic Engineering Conference. The National Academy of Sciences is a private, honorary organization of more than 700 scientists and engineers elected on the basis of outstanding contributions to knowledge. Established by a Congressional Act of Incorporation signed by Abraham Lincoln on March 3, 1863, and supported by private and public funds, the Academy works to further science and its use for the general welfare by bringing together the most qualified individuals to deal with scientific and technological problems of broad significance. Under the terms of its Congressional charter, the Academy is also called upon to act as an official-yet independent adviser to the Federal Government in any matter of science and technology. This provision accounts for the close ties that have always existed between the Academy and the Government, although the Academy is not a governmental agency and its activities are not limited to those on behalf of the Government.

Written towards the end of 1937 during his Europe trip, after being nominated the President of the Indian National Congress, An Indian Pilgrim traces Bose's life story from birth till his resignation from the Indian Civil Service. It is an astounding account of his ideological development and his singular focus on India's reconstruction in which Swami Vivekananda played a large part—"I was barely fifteen when Vivekananda entered my life. Then there followed a revolution within and everything was turned upside down." The book recounts the development of the spirit of service, sacrifice and zeal for national liberation, which were the driving forces of his life. We hope this publication will gain wide circulation so that the spirit of Subhas Chandra Bose becomes the guiding light of the country's youth in these disturbing times.
