In recent years, the field of tissue engineering has begun, in part, to c- lesce around the important clinical goal of developing substitutes or repla- ments for defective tissues or organs. These efforts are focused on many tissues including skin, cartilage, liver, pancreas, bone, blood, muscle, the vascu- ture, and nerves. There is a staggering medical need for new and effective treatments for acquired as well as inherited defects of organs/tissues. Tissue engineering is at the interface of the life sciences, engineering, and clinical medicine and so draws upon advances in cell and molecular biology, mate- als sciences, and surgery, as well as chemical and mechanical engineering. Such an interdisciplinary field requires a broad knowledge base as well as the use of a wide assortment of methods and approaches. It is hoped that by bringing together these protocols, this book will help to form connections - tween the different disciplines and further stimulate the synergism underlying the foundation of the tissue engineering field.

The mechanical engineering curriculum in most universities includes at least one elective course on the subject of reciprocating piston engines. The majority of these courses today emphasize the application of thermodynamics to engine ef?ciency, performance, combustion, and emissions. There are several very good textbooks that support education in these aspects of engine development. However, in most companies engaged in engine development there are far more engineers working in the areas of design and mechanical development. University studies should include opportunities that prepare engineers desiring to work in these aspects of engine development as well. My colleagues and I have undertaken the development of a series of graduate courses in engine design and mechanical development. In doing so it becomes quickly apparent that no suitable te- book exists in support of such courses. This book was written in the hopes of beginning to address the need for an engineering-based introductory text in engine design and mechanical development. It is of necessity an overview. Its focus is limited to reciprocating-piston internal-combustion engines – both diesel and spa- ignition engines. Emphasis is speci?cally on automobile engines, although much of the discussion applies to larger and smaller engines as well. A further intent of this book is to provide a concise reference volume on engine design and mechanical development processes for engineers serving the engine industry. It is intended to provide basic information and most of the chapters include recent references to guide more in-depth study.

Neuromodulation is an emerging field that explores the use of electrical, chemical, and mechanical interventions to heal neurological deficits. Such neurostimulation has already shown great promise with disorders and diseases such as chronic pain, epilepsy, and Parkinson's disease. This is the first concise reference covering all of the basic principles of neuromodulation in a single affordable volume for neuro-residents, fellows, and basic clinical practitioners, edited by two prominent clinical experts in the field. This volume emphasizes essential observations from all of the important clinical phases involved in any neuromodulation: targeting, intraoperative assessment, programming, complications, and complication avoidance. There are commonalities to all neuromodulation procedures that must be brought to the forefront to form a cohesive presentation of neuromodulation, and such emphasis will give readers a more solid grounding in the fundamentals needed to embrace this field as a cohesive clinical entity. Chapters offer point-counterpoint commentary for varied perspectives Appendix distills current guidelines in easy, accessible format Chapters follow story of patient care, effectively emphasizing general principles with supporting examples Offers outstanding scholarship, with over 20% of chapters involving international contributors
