Development at 28 Weeks. The baby weighs about 2 pounds, 6 ounces, and changes position often at this point in pregnancy. If you had to deliver prematurely now, there is a good chance the baby ...

Fetal Development - Cornell Institute for Biology Teachers

The chorionic villi have a central core and fetal capillaries, and a double layer of trophoblast cells. The syncytial layer or the outer portion of the two layers produces placental hormones such as hPL, hCG, estrogen, and progesterone. The Langhans' layer is the middle layer and it protects the embryo and fetus from infectious diseases. This layer appears to function as early as 12 days' gestation.

Development Of A Human Fetus Lab Answers Pdf - Fill Online ...

At 8 weeks of pregnancy, the placenta and fetus have been developing for 6 weeks. The placenta forms tiny hairlike projections (villi) that extend into the wall of the uterus. Blood vessels from the embryo, which pass through the umbilical cord to the placenta, develop in the villi.
