Esistono sette valli - spiega Osho - una volta raggiunta la settimana, non ce ne sono più; allora l'uomo ha conseguito il suo essere, non è più paradossale. Non c'è più tensione, nessuna angoscia. Questo è ciò che in Oriente abbiamo chiamato Buddhità. (...) Ascolta quali sono queste sette valli, e cerca di comprenderle. Il maestro illustra nei dettagli quali siano le sette valli dell'anima, i sette momenti esistenziali che il ricercatore del Vero affronterà lungo il cammino. Sono passaggi

che richiedono costanza e dedizione, e che possono essere sofferti, ma sono necessari e inevitabili se si vuole trascendere il proprio piccolo Ego e aprirsi ai misteri e alla gioia dell'esistenza. Osho inoltre mette in guardia il lettore dalle lusinghe e dai tranelli della mente, che cercherà di distogliere il cercatore del Vero dalla meta finale: l'illuminazione.

During his sojourn in Sulaymaniyah in the 1850s Baha'u'llah came into contact with eminent Sufi leaders. In the Seven Valleys and the Four Valleys, epistles revealed for two of them, He sets forth the foundations of a renewed spiritual path. 'Abdu'l-Baha described the Seven Valleys as 'a guide for human conduct'. This major new study focuses on the historical, doctrinal and literary background of the Seven Valley and the Four Valleys, and on Baha'u'llah's revision of Sufi concepts in the light of the teachings of His new Revelation."

Our interest in the microbial biodegradation of xenobiotics has increased many folds in recent years to find out sustainable ways for environmental cleanup. Bioremediation and biotransformation processes harness the naturally occurring ability of microbes to degrade, transform or accumulate a wide range of organic pollutants. Major methodological breakthroughs in recent years through detailed genomic, metagenomic, proteomic, bioinformatic and other high-throughput analyses of environmentally relevant microorganisms have provided us unprecedented insights into key biodegradative pathways and the ability of organisms to adapt to changing environmental conditions. The degradation of a wide spectrum of organic pollutants and wastes discharged into the environment by anthropogenic activities is an emerging need today to promote sustainable development of our society with low environmental impact. Microbial processes play a major role in the removal of recalcitrant compounds taking advantage of the astonishing catabolic versatility of microorganisms to degrade or transform such compounds. New breakthroughs in sequencing, genomics, proteomics, bioinformatics and imaging are generating vital information which opens a new era providing new insights of metabolic and regulatory networks, as well as clues to the evolution of degradation pathways and to the molecular adaptation strategies to changing environmental conditions. Functional genomic and metagenomic approaches are increasing our understanding of the relative importance of different pathways and regulatory networks to carbon flux in particular environments and for particular compounds. New approaches will certainly accelerate the development of bioremediation technologies and biotransformation processes in coming years for natural attenuation of contaminated environments
