Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. *Strategies to Improve Cardiac Arrest Survival* examines the complete system of response to cardiac arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of *Strategies to Improve Cardiac Arrest Survival* provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.

Until recently, the cellular basis for sudden death, the Brugada Syndrome, has largely remained an unknown to modern arrhythmologists and cardiologists, particularly in the absence of any structural heart disease. Detailed observations of age-groups, especially the young, families and populations where sudden death frequently occurs, and improved understanding of its contributory factors and mechanisms are, however, showing the way forward. This addition to the Clinical Approaches to Tachyarrhythmias (CATA) Series, written by the investigators who discovered and probed the Brugada Syndrome, discusses the history, etiology, pathology and clinical manifestations of sudden death. From diagnosis, prognosis, to therapeutic approaches using the latest catheter ablation techniques, electrophysiological surgery, and genetic appraisal, the work is a testimony to the author's investigation. Using clinical cases in Thailand and Laos, they further unravel the syndrome's molecular mechanisms, studying related syndromes, such as the long-QT syndrome, infant death, and arrhythmogenic right ventricular cardiomyopathy. By being informed of the electrophysiological abnormalities that contribute to familial and genetic diseases, physicians, cardiologists and all those who care for patients with cardiac arrhythmias will be better able to identify and treat patients in whom the Brugada Syndrome may strike next.

Intravascular thrombus formation remains one of the most significant problems in cardiovascular medicine. It underlies the clinical presentation of acute coronary syndromes, including unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI) and ST-segment elevation myocardial infarction. More and more individuals are stricken with an acute MI and undergo a percutaneous coronary intervention (PCI). Several reasons apply, including an increasingly aged population, the growing burden of chronic risk factors such as diabetes, obesity, sedentary behaviour, and improvements in early recognition and intervention. Thrombus formation also results in substantial morbidity and mortality. Despite significant advances in prevention and treatment of venous thromboembolism, pulmonary embolism remains a common preventable cause of hospital deaths. Implementing the most appropriate, and safe, anticoagulation therapy across the spectrum of cardiovascular disease in the presence of a wide range of other risk factors remains a challenge. Written by leading authorities in the field, Management Strategies in Antithrombotic Therapy offers a comprehensive review of antithrombotic therapy, including the latest therapies, risk factors and evidence-based strategy. The book acquaints readers with the data behind the commonly used antithrombotic agents and assists them in formulating a sound, evidence-based therapeutic strategy appropriate for each patient. This book is an invaluable resource for all postgraduate students and specialist physicians in cardiovascular medicine, cardiac and vascular
