How do we incorporate analytical thinking into public policy decisions? Stuart Shapiro confronts this issue in *Analysis and Public Policy* by looking at various types of analysis, and discussing how they are used in regulatory policy-making in the US. By looking at the successes and failures of incorporating cost-benefit analysis, risk assessment, and environmental impact assessment, he draws broader lessons on its use, focusing on the interactions between analysis and political factors, legal structures and bureaucratic organizations as possible areas for reform. Utilizing empirical and qualitative research, Shapiro analyzes four different forms of analysis: cost-benefit analysis, risk assessment, environmental impact assessment, and impact analysis. After interviewing nearly fifty individuals who have served in high levels of government, and who have made countless regulatory policy decisions in their careers, Shapiro argues that advocates must become less ambitious and should craft requirements for simpler and clearer analysis. Such analysis, particularly if informed by public participation, can do a great deal to improve government decisions. As this book details the relationship between analysis and institutional factors such as politics, bureaucracy, and law, it is appropriate for a variety of readers, such as scholars of policy, students, scholars of regulation, and congressional and state legislative staff looking to create new analytical requirements.

"This book examines interpretations of the role of the supervisor, and also the supporting committees and structures in doctoral research projects. It offers the best practices in supervision that would accommodate context dependent multiple realities in multidisciplinary research projects, capitalize on available knowledge sharing technologies, and also transcend boundaries along the research life cycle"--

The authors trace the emergence of Ataturk and Reza Shah through the constitutional revolutions in Iran and the Ottoman Empire, which led to the introduction of European social models, the establishment of dictatorship and of secularist reforms. This produced in both Turkey and Iran highly authoritarian, nationalist, and quasi-westernised states, where the personality cult of the leader defined the politics of each country."

This book provides an overview of the ACCESS program, a mental health program that has been developed and tested as an efficacious treatment for college students with ADHD. This program is at the cutting edge of clinical research, incorporating treatment strategies that allow for dissemination in real world settings in order to effectively assist college students experiencing difficulties in their academic, personal, social, and emotional functioning. As cognitive behavioral approaches have proved to be the most successful psychological treatments to date, the techniques in this volume follow that model in a detailed and nuanced fashion. The authors provide a week by week breakdown of the program, supplemented by handouts and worksheets designed to facilitate better understanding of the areas targeted by the program. Filling a notable gap in research addressing the ADHD college student population, CBT for College Students with ADHD is a crucial resource for campus mental health practitioners as well as a broad range of clinicians dealing with emerging adults.

In the context of Geographical Information Systems (GIS) the book offers a timely review of Map Projections. The first chapters are of foundational type. We introduce the mapping from a left Riemann manifold to a right one specified as conformal, equiaerial and equidistant, perspective and geodetic. In particular, the mapping from a Riemann manifold to a Euclidean manifold ("plane") and the design of various coordinate systems are reviewed . A speciality is the treatment of surfaces of Gaussian curvature zero. The largest part is devoted to the mapping the sphere and the ellipsoid-of-revolution to tangential plane, cylinder and cone (pseudo-cone) using the polar aspect, transverse as well as oblique aspect. Various Geodetic Mappings as well as the Datum Problem are reviewed. In the first extension we introduce optimal map projections by variational calculus for the sphere, respectively the ellipsoid generating harmonic maps. The second extension reviews alternative maps for structures , namely torus (pneu), hyperboloid (cooling tower), paraboloid (parabolic mirror), onion shape (church tower) as well as clothoid (Hight Speed Railways) used in Project Surveying. Third, we present the Datum Transformation described by the Conformal Group C10 (3) in a threedimensional Euclidean space , a ten parameter conformal transformation. It leaves infinitesimal angles and distance ratios equivariant. Numerical examples from classical and new map projections

as well as twelve appendices document the Wonderful World of Map Projections.
