New approaches to this most fluid of medieval genres, considering in particular its reception and transmission. Romance was the most popular secular literature of the Middle Ages, and has been understood most productively as a genre that continually refashioned itself. The essays collected in this volume explore the subject of translation, both linguistic and cultural, in relation to the composition, reception, and dissemination of romance across the languages of late medieval Britain, Ireland, and Iceland. In taking this multilingual approach, this volume proposes a re-centring, and extension, of our understanding of the corpus of medieval Insular romance, which although long considered extra-canonical, has over the previous decades acquired something approaching its own canon - a canon which we might now begin to unsettle, and of which we might ask new questions. The topics of the essays gathered here range from Dafydd ap Gwilym and Walter Map to Melusine and English Trojan narratives, and address topics from women and merchants to werewolves and marvels. Together, they position the study of romance in translation in relation to cross-border and cross-linguistic transmission and reception; and alongside the generic re-imaginings of romance, both early and late, that implicate romance in new linguistic, cultural, and social networks. The volume also shows how, even where linguistic translation is not involved, we can understand the ways in which romance moved across cultural and social boundaries and incorporated elements of different genres into its own capacious and malleable frame as types of translatio - in terms of learning, or power, or both. women and merchants to werewolves and marvels. For Stirling engines to enjoy widespread application and acceptance, not only must the fundamental operation of such engines be widely understood, but the requisite analytic tools for the stimulation, design, evaluation and optimization of Stirling engine hardware must be readily available. The purpose of this design manual is to provide an introduction to Stirling cycle heat engines, to organize and identify the available Stirling engine literature, and to identify, organize, evaluate and, in so far as possible, compare non-proprietary Stirling engine design methodologies. This report was originally prepared for the National Aeronautics and Space Administration and the U. S. Department of Energy.

Mechatronics as a discipline has an ever growing impact on engineering and engineering education as a defining approach to the design, development, and operation of an increasingly wide range of engineering systems. The increasing scope and complexity of mechatronic systems means that their design and development now involve not only the technical aspects of its core disciplines, but also aspects of organization, training, and management. Mechatronics and the Design of Intelligent Machines and Systems reflects the significant areas of development in mechatronics and focuses on the higher-level approaches needed to support the design and implementation of mechatronic systems. Throughout the book, the authors emphasize the importance of systems integration. Each chapter deals with a particular aspect of the design and development process, from the specification of the system to software design and from the human-machine interface to the requirements for safe operation and effective manufacture. Notable among this text's many features is the use of a running case study-the autonomous and robotic excavator LUCIE-to illustrate points made in various chapters. This, combined with the authors' clear prose, systematic organization, and generous use of examples and illustrations provides students with a firm understanding of mechatronics as a discipline, some of the problems encountered in its various areas, and the developing techniques used to solve those problems.
