Most of what you have previously covered is time-independent quantum mechanics, where we mean that the Hamiltonian H_0 is assumed to be independent of time: $H_0=H_0(r)$. We then assume a solution with a form in which the spatial and temporal variables in the wavefunction are separable: $\Psi(r,t)=\psi(r)\phi(t)$

In particular, I like Liboff's discussion on good/bad quantum numbers and the matrix representation of quantum mechanics. The corresponding discussion in Griffiths is really lacking. My main complaint regarding Liboff is that some sections seem to be out of context, in particular the last few sections in chapter 7, 8 and 11.

Quantum Mechanics 6 The subject of most of this book is the quantum mechanics of systems which have a small number of degrees of freedom. The book is a mix of descriptions of quantum mechanics itself, the general properties of systems described by quantum mechanics, and general techniques for describing their behavior.
