Then the tabular form of the linear-programming formulation associated with the network of Fig. 8.1 is as shown in Table 8.2. The first five equations are flow-balance equations at the nodes. They state the conservation-of-flow law, Flow out of a node - Flow into a node = Net supply at a node. As examples, at nodes 1 and 2 the balance equations are:

Network Models 8 - MIT

Many business problems involve flows through a network – transportation, stages of an industrial process, routing of data. Students taking this course learn to specify and implement

optimization models that solve network problems (what is the shortest path through a network, what is the least cost way to route material through a network with multiple supply nodes and multiple demand nodes).
