This is a flexible LP system for academics and corporate users alike. Some of its features include: 40 commands and display options;

Release 5.2 has an integer crack-growth test specimen solver which should reduce solution times on integer program; and an option to output solution in industry-standard MPS format.

LINDO Course Technology The report has been prepared to provide a users' manual for the a linear programming code named SMPLEX and a matrix generator named MAGEN. The SMPLEX code uses the Revised Simplex Method to solve linear programming problems 899 variables. The MAGEN matrix generator can be used to facilitate input data preparation for SMPLEX. (Author). The User's Manual is furnished in connection with the task Linear Programming for Communications Networks and describes how to use the computer programs prepared under the subject task. It is distinct from (1) the Final Technical Report which provides a general overview of the task as well as descriptions of the linear programming models that characterize communication network problems and (2) the Program Report which provides information to programmers who may wish to modify the programs. The approach taken in the User's Manual is to provide a general guide to the programs and to suggest solution procedures to specific examples. (Author).

This software is an integration of tools and simulators designed to help the user solve the most common feedforward predistorted amplifier design equations, including calculating gain and loop balance, optimum coupling ratios, and more. It includes the tools needed everyday, such as a microstrip calculator and parallel coupler designer, to relieve the user of lengthy calculations and help predict the performance of a complex amplifier before all the blocks are together. PACAD also features a nonlinearity simulator that simulates the intermodulation characteristics of an amplifier given the amplifier's compression gain and phase curves. This tool helps calculate the required characteristics of an optimum predistortion block, and simulates the combination of predistortion and

amplifier in terms of intermodulation products - taking the guesswork out of predistortion block design. There is an accompanying user's manual in this package. GALIMA
