Lippincott's Illustrated Review of Biochemistry - Indian Edition Lippincott Williams & Wilkins

More than ten years ago, the faculty members of the Department of Pharmacology at the University of Oklahoma College of Medicine developed a review book of medical pharmacology in response to requests from our second year medical students who were preparing to sit for the Part I examination of the National Board of Medical Examiners. The students expressed a need for an organized approach to cope with the volume of basic science curricular material presented during the first two years. Therefore, our review book was not designed to provide a comprehensive text on pharmacology, but rather to provide the students with a significant core of information, as a refresher, after they had successfully completed a basic course in pharmacology. This book represents a major revision of our review of medical pharmacology. The book has been reorganized, updated and expanded to provide current information on major new drugs and information on older drug groups that typically are covered on licensure examinations. The book also has been expanded to include a large number of new questions for self-examination. The faculty have endeavored to retain a reasonably concise, relevant and readable review book that will provide the students with a thorough review of pharmacology. Students are advised to refer to comprehensive textbooks, as needed, to fill in any gaps in their knowledge which may be

disclosed by the self-examinations.

Textbook of Biochemistry for Medical Students Wiley

The fourth edition of textbook of biochemistry is a comprehensive introduction to the basic concepts of biochemistry for undergraduate students of medicine. It covers all the topics and core competencies specified by the MCI in its 'competency-based undergraduate curriculum' Effective from August 2019. The topics are developed in a manner that encourages students to think analytically as opposed to memory-based learning. Links between biochemistry and other medical subjects provided throughout the book help to reinforce this approach. A consistent feature of the book is the liberal use of illustrations, tabular layouts and highlighted text, which makes the assimilation and recall of the inherently complex aspects of biochemistry easy. In this edition, descriptions of topics which may fall under the category of additional reading have been set off from the regular text in a smaller font size to distinguish them from the essential content. This feature, along with comprehensive Chapter summaries will help students to optimise the time spent in revising for examinations. The chapter-end exercises comprising review questions, MCQs, case studies, riddles and other problems will further enhance the revision experience. The problems-based exercises and case studies often reveal additional insights on the core concepts covered in the book.

This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.
