This new book provides and introductory text on the science and technology of materials in automotive engines. It focuses on reciprocating engines, both four and two-stroke, with particular emphasis on their characteristics and the materials used in their construction. The books considers the engine in terms of each specific part : the

piston, cylinder, camshaft valves, crankshaft, connecting rod and catalytic converter. It also covers the metallurgy, surface modification, wear resistance, and chemical composition of the materials considered and it will include supplementary notes that support the core text. The book will be essential reading for engineers and designers of engines, as well as lecturers and graduate students in the

fields of combustion engineering, machine design, and materials science looking for a concise, expert analysis of automotive materials. Introduction to Maintenance, Repair and Overhaul of Aircraft, Engines and Components brings

together the basic aspects of a fundamentally important part of the aerospace industry, the one that supports the global technical efforts to keep passenger and cargo planes flying reliably and safely. Over time, aircraft components and structural parts are subject to environmental effects, such as corrosion and other types of material deterioration, wear and fatigue. Such parts could fail in service and affect the safe operation of the aircraft if the degradation were not detected and addressed in time.

Regular planned maintenance supports the current and future value of the aircraft by minimizing the physical decline of the aircraft and engines

throughout its life.

Introduction to Maintenance, Repair and Overhaul of Aircraft, Engines and Components was written by the industry veteran, Shevantha K.

Weerasekera, an aerospace engineer with 20+ years of aircraft maintenance experience, who currently leads the engineering team of a major technical enterprise in the field.
