Since then, numerous extensions and generalizations of this inter-rater agreement measure have been proposed in the literature. This paper reviews and critiques various approaches to the study of interrater agreement, for which the relevant data comprise either nominal or ordinal categorical ratings from multiple raters.

In this review, the Manchester Triage System shows a wide inter-rater agreement range with a prevalence of good and very good agreement. Its safety was low because of the high rate of undertriage and the low sensitivity in predicting higher urgency levels.

Conclusions: This review found 'moderate' evidence that

raters can achieve acceptable levels of inter-rater and intra-rater reliability of composite FMS scores when using live ratings.

Overall, there were few high-quality studies, and the quality of several studies was impacted by poor study reporting particularly in relation to rater blinding.

*Literature Review Of Inter Rater Reliability*  
Inter-Rater Reliability refers to statistical measurements that determine how similar the data collected by different raters are. A rater is someone who is scoring or

measuring a performance, behavior, or skill in a human or animal.

## Review of Diagnostic Studies

To evaluate inter-rater reliability, we chose to compute intra-class correlations (ICC's) instead of alternative measures because they tend to suffer less from high or low agreement and they provide a clearer understanding of the rate of consistency among the raters [7, 8]. The ICC provides an adequate but not essential estimation of inter-rater

reliability.

The literature reviewed does demonstrate that the assessment community's understanding of the factors affecting reliability has broadened, leading to a number of approaches that can be used to improve the reliability of results.
