Programmable Logic Controllers begins by covering the hardware and architecture of the Allen-Bradley Small Logic Controller (SLC 500) series of PLCs. I/O devices and motor controls are also covered as well as commonly used number systems, such as binary and BCD. PLC programming is introduced by reviewing and creating examples of relay ladder diagrams. In the following chapter, students are given guidelines and examples for creating PLC ladder diagrams based on relay ladder diagrams. Throughout the rest of the textbook, the most common PLC functions are presented, and practical examples are given based on the Allen-Bradley RSLogix programming software. The Laboratory Manual provides a combination of RSLogix and LogixPro activities that help students practice and hone their PLC programming skills. Included in the textbook is a CD-ROM containing LogixPro simulation software. The software allows students to practice and develop

their programming skills when and where they want. LogixPro is not a replacement for RSLogix, nor is there support for file exchange or communication with actual Allen-Bradley products. LogixPro provides a complete software-based training solution, eliminating the need for expensive PLC equipment.

Historically, grief and spirituality have been jealously guarded as uniquely human experiences. Although non-human animal grief has been acknowledged in recent times, its potency has not been recognised as equal to human grief. Anthropocentric philosophical questions still underpin both academic and popular discussions. In *Enter the Animal*, Teya Brooks Pribac examines what we do and don't know about grief and spirituality. She explores the growing body of knowledge about attachment and loss and how they shape the lives of both human and non-human animals. A valuable addition to the vibrant interdisciplinary

conversation about animal subjectivity, *Enter the Animal* identifies conceptual and methodological approaches that have contributed to the prejudice against nonhuman animals. It offers a compelling theoretical base for the consideration of grief and spirituality across species and highlights important ethical implications for how humans treat other animals.

Plenty of books in the business section lay out strategies for success in the working world and in life, but many of them

seem like they are designed for people who want an excuse to avoid real work, making unrealistic promises about "life-hacking" and other dubious efforts. CrossFit champion and multi-million-dollar business owner Jason Khalipa sees things differently. He found his success in other, more honest ways, like valuing hard work and making every minute count. The role models who informed his career were people who went to work early, stayed late, and did everything they could to fill each hour with as much productivity as they could find within themselves to give. Finding Your Why outlines Jason's unique model for success, which comes down to simple but important things like acting with intention, setting high standards, maintaining good values, treating others well, putting family first, and doing hard, relentless work. All of this is driven by finding your why - the life's purpose that motivates you to be the best possible version of yourself. Don't be suckered by promises of a three-hour workweek or hacking your way to greatness. Success is about taking real ownership of your goals and putting in the work to achieve them. In this book, Jason shares life lessons from a variety of arenas, from the field of elite CrossFit competition to the cutthroat world of gym ownership to the cancer ward at Stanford University, where his daughter

is engaged in a tough battle of her own. Chapter topics include:
- The AMRAP ["As Many Rounds As Possible"] Mentality - The Ownership Attitude - Mentors - Looking Three Steps Ahead - Learning from Failures - Controlled Paranoia

Computer languages and computer graphics have become the primary modes of human-computer interaction. This book provides a basic introduction to "Real and Virtual Environment" computer modelling. Graphics models are used to illustrate both the way computer languages are processed and also used to create computer models of graphic displays. Computer languages have been bootstrapped from machine

code, to high-level languages such as Java, to animation scripting languages.

Integrating graphic and computer models takes this support for programming, design and simulation work, one step further, allowing interactive computer graphic displays to be used to construct computer models of both real and virtual environment systems. The Java language is used to implement basic algorithms for language translation, and to generate graphic displays. It is also used to simulate the behaviour of a computer system, to explore the way programming and design-simulation environments can be put together.
