With amazing low-light capabilities, incredible definition, intelligent autofocus and a host of other features, digital cameras have now become so powerful that they have left their users behind. Most photographers can take competent shots in a range of conditions, or fix imperfect exposures in Photoshop or Lightroom, but very few have the skill to push their cameras to the limit and capture the perfect shot, under all conditions, with no post-processing required. In Camera is the perfect way to take your photography to that level; to master your camera, understand light, exposure and composition, and make amazing photographs, whatever your camera, without cheating after the event. One hundred of Gordon's beautiful photos are given with his own expert commentary; full settings and camera details are included, and a host of tips and tricks let photographers of any level learn something from every example. The shots are taken with a wide range of cameras, and the emphasis is on getting results by improving your own skills, not wasting money on expensive equipment.

Over the past twenty years there has been a significant increase in underwater activities such as scuba diving which, coupled with the adventure and romance always associated with shipwrecks, has led to rapid developments in the discovery and excavation of shipwrecked material. These shipwrecks are invaluable archaeological 'time capsules', which in the majority of cases have come to an equilibrium with their environment. As soon as artefacts on the wreck site are moved, this equilibrium is disturbed, and the artefacts may commence to deteriorate, sometimes in a rapid and devastating fashion. In fact excavation without having conservation facilities available is vandalism--the artefacts are much safer being left on the sea bed. Such famous shipwrecks as the Mary Rose (1545), the *Wasa* (1628) and the *Batabia* (1629) have not only brought the world's attention to these unique finds, but have also produced tremendous conservation problems. The treatment of a 30 metre waterlogged wooden hull or large cast iron cannon is still causing headaches to conservators.

The Mary Rose, one of the first great British warships and Henry VIII's flagship, sank in 1545, taking all her contents and most of her crew to the bottom of the sea. The conservation of the hull of the Mary Rose, and more than 26,000 objects recovered during her excavation, has been a massive undertaking. The complex process of conservation was begun even before the hull was raised from the seabed in 1982, and continues today. For *Future Generations: Conservation of a Tudor Maritime Collection* is one of the series of books published by the Mary Rose Trust, with the Heritage Lottery Fund, on the archaeology of the Mary Rose. It provides an introduction to the conservation programme devised for the Mary Rose, and the principles, objectives and problems of marine archaeological conservation. A huge range of objects were recovered from the ship, including wood, textiles, leather, ceramics, glass, stone, metals, rope, pieces of sail-cloth, and many hundreds of animal and human bones. Almost all

objects required some kind of treatment to halt the effects of 450 years of immersion in saltwater. This volume explains the conservation methods used for the treatment and preservation of each major category of material. It describes the processes of decay and degradation and the results of bacterial and animal infestation that affect shipwrecks in general, and the Mary Rose in particular. The variety and immensity of the task facing the excavators of the Mary Rose was so great that new methods and treatments had to be devised and tested. It proved to be ground-breaking work. The conservation work did not stop with the stabilisation of the hull and objects from the wreck. Museum display and the continuing storage of most objects presented their own problems. This volume also describes the design and construction of specialised display cases, ensuring that the museum could control and monitor potentially destructive environmental factors such as light, humidity, heat and atmospheric pollution, as well as allowing good public access to the objects.
