Milestones in Immunology: Based on Collected Papers contains scientific milestones relating to the history of medicine over the past two centuries. The book highlights the contributions of pioneering scientists whose discoveries have paved the way for researchers working in the field of immunology. As the science of immunology grew from knowledge that survivors of common infectious diseases rarely contracted them again, the book uses this as a central thesis, helping readers understand how the adaptive immune system aids in defense against pathogens. In addition, the book covers special fields, such as immunohistochemistry, immunogenetics and immunopathology. For the past century, immunology has fascinated and inspired some of the greatest scientists of our time. Numerous Nobel Prizes have been awarded for fundamental discoveries in immunology, from Paul Ehrlich's work on antibodies (1908) to the studies of Zinkernagel and Doherty (1986) elucidating mechanisms of cell-mediated immunity. Nanoparticles and the Immune System provides a reference text for toxicologists, materials scientists and regulators and covers the key issues of interaction of nanomaterials with the immune system. The book discusses several issues that toxicologists and regulators need to know: identification of endpoints that are relevant for assessing hazard, evaluating impact on immunologically frail populations, and how to evaluate chronic/cumulative effects. In addition, the book addresses the possibility of turning the immunomodulating properties of certain nanomaterials to our advantage for amplifying immune responses in certain diseases or preventive strategies (e.g. vaccination). Identifies endpoints relevant for assessing hazardous situations, evaluating the impact on immunologically frail populations and how to gauge chronic/cumulative effects Raises the awareness of the importance of knowing the effects of the new nanomaterials on our immune system

The formation of blood vessels is an essential aspect of embryogenesis in vertebrates. It is a central feature of numerous post-embryonic processes, including tissue and organ growth and regeneration. It is also part of the pathology of tumour formation and certain inflammatory conditions. In recent years, comprehension of the molecular genetics of blood vessel formation has progressed enormously and studies in vertebrate model systems, especially the mouse and the zebrafish, have identified a common set of molecules and processes that are conserved throughout vertebrate embryogenesis while, in addition, highlighting aspects that may differ between different animal groups. The discovery in the past decade of the crucial role of new blood vessel formation for the development of cancers has generated great interest in angiogenesis (the formation of new blood vessels from pre-existing ones), with its major implications for potential cancer-control strategies. In addition, there are numerous situations where therapeutic treatments either require or would be assisted by vasculogenesis (the de novo formation of blood vessels). In particular, post-stroke therapies could include treatments that stimulate neovascularization of the affected tissues.

The development of such treatments, however, requires thoroughly understanding the developmental properties of endothelial cells and the basic biology of blood vessel formation. While there are many books on angiogenesis, this unique book focuses on exactly this basic biology and explores blood vessel formation in connection with tissue development in a range of animal models. It includes detailed discussions of relevant cell biology, genetics and embryogenesis of blood vessel formation and presents insights into the cross-talk between developing blood vessels and other tissues. With contributions from vascular biologists, cell biologists and developmental biologists, a comprehensive and highly interdisciplinary volume is the outcome.

Fernando Cabanillas In 1993, Fisher et al. published the results of a randomized trial comparing three third-generation regimens against the classic CHOP combination. For several years, the oncology community had been convinced that the third generation regimens were clearly superior to CHOP. It came as a shock to many that there was no difference in outcome between the four arms of this clinical trial. The logical conclusion is that CHOP is as good as any of the other regimens tested in that study. Unfortunately, this excellent study has been misinterpreted by many as proving that there has not been any progress in the field of lymphoma during the last 20 years. Furthermore, it has led to a fatalistic attitude in the reasoning of many clinicians who feel that 'nothing works better than CHOP' and therefore that it is not worth testing new drugs or developing novel regimens. However, the process by which we move forward in the oncology field is seldom by dramatic breakthroughs. Frequently, what appears at first glance to be a breakthrough turns out later to be just a modest step forward. Several steps forward eventually add up to a

major advance, but this advance goes unnoticed because of the slow nature of the process. In this volume, we have chosen to discuss several of these steps, which we feel are clearly making a positive impact on the field of lymphomas and which soon should make a major difference in therapeutic results.
