With the same style and insight he brought to his previous studies of American cinema, acclaimed critic David Thomson masterfully evokes the history of America's love affair with the movies and the tangled history of Hollywood in *The Whole Equation*. Thomson takes us from D.W. Griffith, Charlie Chaplin, and the first movies of mass appeal to Louis B. Mayer, who understood what movies meant to America – and reaped the profits. From Capra to Kidman and Hitchcock to Nicholson, Thomson examines the passion, vanity, calculation and gossip of Hollywood and the films it has given us. This one-volume history is a brilliant and illuminating overview of “the wonder in the dark” – and the staggering impact Hollywood and its films has had on American culture.

The Microbiological Quality of Food: Foodborne Spoilers specifically addresses the role of spoilers in food technology and how they affect the quality of food. Food spoilers represent a great challenge in food quality, determining the shelf-life of many products as they impact consumer acceptability of taste, texture, aroma, and other perceptions. Divided into four sections, the first section defines microbial spoilage of food, with special emphasis on methods for the evaluation of spoiling phenomena and the status of their regulatory framework, examining both existing regulations and possible gaps. The second section examines spoiling microorganisms, covering a range of common spoilage microorganisms, including pseudomonas, yeasts, and

molds and spore formers, as well as less-common spoilers, including lactic acid bacteria and specific spoilage organisms in fish. The third section highlights spoiling phenomena within certain food types. Chapters cover dairy, fish, meat, and vegetables, and other products. The final section investigates emerging topics which point to future trends in the research of food spoilers. There is insight into microorganisms resistant to preservation, the role of biofilms in food quality, and the link between food safety and food spoilage, with a special emphasis on certain spoiling microorganisms which could be opportunistic pathogens. Written by an international team of leading authors, this book provides state-of-the-art coverage of this topic, which is essential to the shelf-life and quality of food. - Provides in-depth coverage of the different spoilers which cause the deterioration of foods, including less common spoilers not covered in other publications - Includes dedicated chapters covering the spoilage of specific products, making this book ideal for those working in the food industry - Presents a framework for future research in the area of foodborne spoilers

America in 2004 is color coded—and it's not just a matter of red, white, and blue. The terror alert bounces from yellow to orange. The economy offers up a hundred shades of red ink. The environment is turning

brown. National security is cloaked in gray shadows. And Jim Hightower covers it all with uncommon insight, political fearlessness, and laugh-out-loud humor. America's #1 populist gives us Let's Stop Beating Around the Bush—a hard-hitting, fact-filled review of the real state of the union that you won't get from the establishment media. With his daily radio commentaries and award-winning monthly newsletter, no one has chronicled the madness of King George the W, the wimpiness of corporate Democrats, and the aggressive avarice of Wall Street with the thoroughness and tenacity of Hightower. Now he brings that investigative punch into this wild and woolly book of fiery essays. With his satirical “Six Perfectly Good Reasons to Re-elect George W. Bush;” his mix of damning indictments and uplifting stories; and side bars, cartoons, games, and puzzles, Hightower has done the impossible: He has created a subversive read that makes politics fun again.

Obstetrics is the branch of medicine which specializes in the care of women during gestation and childbirth. The field encompasses both prenatal and postnatal care of the mother and the infant. Fetal screening helps to assess the viability of the fetus and investigate the presence of any congenital abnormalities. Other methods such as nonstress test, fetal karyotype, fetal haematocrit and oxytocin challenge test are used for fetal assessment. In case of fetal distress, placental malfunction, pre-eclampsia and intrauterine growth retardation, labor may be medically induced. Ectopic pregnancy, placental abruption, shoulder dystocia, obstetrical haemorrhage and puerperal sepsis are certain obstetrical emergencies which require immediate medical attention. Postnatal care is provided to the mother following parturition. The infant's health is also monitored and the mother is advised regarding baby care. This book aims to shed light on some of the unexplored aspects of obstetrics

and the recent researches in this field. When bacteria attach to and colonise the surfaces of food processing equipment and food products themselves, there is a risk that biofilms may form. Human pathogens in biofilms can be harder to remove than free microorganisms and may therefore pose a more significant food safety risk. Biofilms in the food and beverage industries reviews the formation of biofilms in these sectors and best practices for their control. The first part of the book considers fundamental aspects such as molecular mechanisms of biofilm formation by food-associated bacteria and methods for biofilm imaging, quantification and monitoring. Part two then reviews biofilm formation by different microorganisms. Chapters in Part three focus on significant issues related to biofilm prevention and removal. Contributions on biofilms in particular food industry sectors, such as dairy and red meat processing and fresh produce, complete the collection. With its distinguished editors and international team of contributors, Biofilms in the food and beverage industries is a highly beneficial reference for microbiologists and those in industry responsible for food safety. - Considers fundamental aspects concerning the ecology and characteristics of biofilms and considers methods for their detection - Examines biofilm formation by different microorganisms such as salmonella and food spoilage - Discusses specific issues related to biofilm prevention and removal, such as cleaning and sanitation of food contact surfaces and food processing equipment
