Will a magnet pick up a paper clip or a feather? The answer is, just the paper clip. Magnets only pick up things that contain bits of iron. In this new addition to the Let's-Read-and-Find-Out Science series, veteran

author Franklyn Branley explains the properties and behavior of magnets. True Kelley's charming illustrations will entertain readers as they discover for themselves what makes a magnet. Hands-on activities include making a magnet and compass.

Magnets Bearport Publishing Read and Experiment is an engaging series, introducing children to scientific concepts. Explore the world of magnets with clear text, real-world examples and fun, safe step-by-step experiments. This book brings the science of magnets to life, explaining the

concepts and encouraging children to be hands-on scientists.
Magnet Mania The Rosen Publishing Group, Inc This hands-on, minds-on approach to science teaches the attributes of magnets through scientific experimentation. Your students will gauge the ability a magnet has to attract objects, judge which magnets are the strongest, measure how far a magnet pulls an object, build a compass, and more. Each of the 14 lessons consists of a teacher's background information sheet and a reproducible student worksheet. Your students will

love learning about magnets while completing the fun experiments. They will not only gain an understanding about magnets and their functions, but also how scientific experimentation can answer many of the questions they may have about the world. Magnets HC Pro, Inc. Readers will enter the exciting world of science with this guide to experiments with magnets and electricity! They'll learn about currents, batteries, circuits, and more through hands-on application of these

essential concepts. Detailed instructions and photos guide readers through each step of every experiment, and a helpful question-and-answer feature answers any questions that could be encountered while experimenting. A concluding quiz asks readers to check their knowledge—a final test of what they learned from their excellent science experiment! Electricity and Magnetism, Grades 6 - 12 Mockingbird

The Committee to Assess the Current Status and Future Direction of High Magnetic Field Science in the United States was convened by the National Research Council in response to a request by the National Science Foundation. This report answers three questions: (1) What is the current state of high-field magnet science, engineering, and technology in the United States, and are there any conspicuous needs to be addressed? (2) What are the current

science drivers and which scientific opportunities and challenges can be anticipated over the next ten years? (3) What are the principal existing and planned high magnetic field facilities outside of the United States, what roles have U.S. high field magnet development efforts played in developing those facilities, and what potentials exist for further international collaboration in this area? A magnetic field is produced by an electrical current in a metal coil. This current exerts an expansive force on the coil, and a magnetic field is "high" if it challenges the strength and current-carrying capacity of the materials that create the field. Although lower magnetic fields can be achieved using commercially available magnets, research in the highest achievable fields has been, and will continue to be, most often performed in large research centers that possess the materials and systems know-how for forefront research. Only a few high field centers exist around the world; in the United States, the principal center is the National High Magnetic Field Laboratory (NHMFL). High Magnetic Field Science and Its Application in the United States considers continued support for a centralized high-field facility such as NHFML to be the highest priority. This report contains a recommendation for the funding and siting of several new high field nuclear magnetic resonance magnets at user facilities in different regions of the United States. Continued advancement in high-magnetic field science requires substantial

investments in magnets with enhanced capabilities. High Magnetic Field Science and Its Application in the United States contains recommendations for the further development of all-superconducting, hybrid, and higher field pulsed magnets that meet ambitious but achievable goals.
