The Muncie 4-speeds, M20, M21, and M22 are some of the most popular manual transmissions ever made and continue to be incredibly popular. The Muncie was the top high-performance manual transmission GM offered in its muscle cars of the 60s and early 70s. It was installed in the Camaro, Chevelle, Buick GS, Pontiac GTO, Olds Cutlass, and many other classic cars. Many owners want to retain the original transmission in their classic cars to maintain its value. Transmission expert and veteran author Paul Cangialosi has created an indispensable reference to Muncie 4-speeds that guides you through each crucial stage of the rebuild process. Comprehensive ID information is provided, so you can positively identify the cases, shafts, and related parts. It discusses available models, parts options, and gearbox cases. Most important, it shows how to completely disassemble the gearbox, identify wear and damage, select the best parts, and complete the rebuild. It also explains how to choose the ideal gear ratio for a particular application. Various high-performance and racing setups are also shown, including essential modifications, gun drilling the shafts, cutting down the gears to remove weight, and achieving race-specific clearances. Muncie 4-speeds need rebuilding after many miles of service and extreme use. In addition, when a muscle car owner builds a high-performance engine that far exceeds stock horsepower, a stronger high-performance transmission must be built to accommodate this torque and horsepower increase. No other book goes into this much detail on the identification of the Muncie 4-speed, available parts, selection of gear ratios, and the rebuild process.

EcoCAR 3 is a part of the Advanced Vehicle Technology Competition series hosted by the Department of Energy, and it challenges 16 North American university teams to re-engineer a 2016 Chevrolet Camaro and turn it into a hybrid electric vehicle, thus improving the environmental impact of the car while retaining its performance aspects. The Ohio State University ' s EcoCAR 3 vehicle has a plug-in hybrid architecture, with operation in series and parallel power flows. The architecture features a 5-speed manual transmission that was automated by the team to retain the efficiency of a manual transmission while providing the convenience of an automatic transmission. The team-developed controllers manage the clutch and shift actuators to provide supervisory control of the automated manual transmission. The simplicity and efficiency of a manual transmission combined with the advantages provided by the hybrid architecture make it a good candidate for an HEV. This thesis provides an overview of the modeling, component testing, and controls development for the AMT system. The controls development includes high level control for vehicle launch, gearshift process, and strategies used in different hybrid vehicle operation modes.
