Complex Contracting draws on core social science concepts to provide wide-ranging practical advice on how best to manage complex acquisitions. Using a strong analytical framework, the authors assess contract management practices, suggesting strategies for improvement and ways to avoid the pitfalls of managing contracts for large and sophisticated

projects. An in-depth analysis of Complex Contracting the US Coast Guard's Deepwater program is included to illustrate ways to respond to real-world contracting challenges. This high-profile and controversial case consisted of a projected 25-year, \$24 billion contract through which the US Coast Guard would buy a system of new boats, aircraft, communications, and control architecture to replace its aging fleet. The authors explore the reasons why this program, launched with such promise, turned out so poorly, and apply the lessons learned to similarly complex contracting scenarios. This engaging and accessible book has broad applicability and will appeal to policymakers, practitioners, scholars and students.

This book fills a void for a balanced approach to spreadsheet-based decision modeling. In addition to using spreadsheets as a tool to quickly set up and solve decision models, the authors show how and why the methods work and combine the user's power to logically model and analyze diverse decision-making scenarios with software-based solutions. The book discusses the fundamental concepts, assumptions and

limitations behind each decision modeling technique, shows how each decision model works, and illustrates the real-world usefulness of each technique with many applications from both profit and nonprofit organizations. The authors provide an introduction to managerial decision modeling, linear programming models, modeling applications and sensitivity analysis, transportation, assignment and network models, integer, goal, and nonlinear programming models, project management, decision theory, queuing models, simulation modeling, forecasting models and inventory control models. In a contemporary, hypercompetitive ever-changing business world, a manager needs quantitative and factual ways of solving problems related to optimal allocation of resources, profit/loss, maximization/minimization

etc. In this endeavor, the subject of doing research on how to manage and make operations efficient is termed as Operations Research. The reference text provides conceptual and analytical knowledge for various operations research techniques. Readers, especially students of this subject, are skeptic in dealing with the subject because of its emphasis on mathematics. However, this book has tried to remove such doubts by focusing on the application part of OR techniques with minimal usage of mathematics. The attempt was to make students comfortable with some complicated topics of the subject. It covers important concepts including sensitivity analysis, duality theory, transportation solution method, Hungarian algorithm, program evaluation and review technique and periodic review system. Aimed at senior undergraduate and graduate students in the fields of mechanical engineering, civil engineering, industrial engineering and production engineering, this book:

- Discusses extensive use of Microsoft Excel spreadsheets and formulas in solving operations research problems

- Provides case studies and unsolved exercises at the end of each chapter
- Covers industrial applications of various operations research techniques in a comprehensive manner
- Discusses creating spreadsheets and using different Excel formulas in an easy-to-understand manner
- Covers problem-solving procedures for techniques including linear programming, transportation model and game theory

Managerial Decision Modeling John Wiley & Sons
Combines topics from two traditionally distinct quantitative subjects, probability/statistics and management science/optimization, in a unified treatment of quantitative methods and models for management. Stresses those fundamental concepts that are most important for the practical analysis of management decisions: modeling and evaluating uncertainty explicitly, understanding the dynamic nature of decision-making, using historical data and limited information effectively, simulating complex systems, and allocating scarce resources optimally.
