The light-duty vehicle fleet is expected to undergo substantial technological changes over the next several decades. New powertrain designs, alternative fuels, advanced materials and significant changes to the vehicle body are being driven by increasingly stringent fuel economy and greenhouse gas emission standards. By the end of the next decade, cars and light-duty trucks will be more fuel efficient, weigh less, emit less air pollutants, have more safety features, and will be more expensive to purchase relative to current vehicles. Though the gasoline-powered spark ignition engine will continue to be the dominant powertrain configuration even through 2030, such vehicles will be equipped with advanced technologies, materials, electronics and controls, and aerodynamics. And by 2030, the deployment of alternative methods to propel and fuel vehicles and alternative modes of transportation, including autonomous vehicles, will be well underway.

What are these new technologies - how will they work, and will some technologies be more effective than others? Written to inform The United States Department of Transportation's National Highway Traffic Safety Administration (NHTSA) and Environmental Protection Agency (EPA) Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emission standards, this new report from the National Research Council is a technical evaluation of costs, benefits, and implementation issues of fuel reduction technologies for next-generation light-duty vehicles. Cost,

Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles estimates the cost, potential efficiency improvements, and barriers to commercial deployment of technologies that might be employed from 2020 to 2030. This report describes these promising technologies and makes recommendations for their inclusion on the list of technologies applicable for the 2017-2025 CAFE standards.

Retrospective Conversion Navy Comptroller Manual: Appropriation cost and property accounting (field)Return on Investment Manual
Retrospective Conversion is an essential guide for library catalogers and technical services managers in the process of converting manual catalog records to machine readable form. It clearly illustrates the advantages and disadvantages of the three conversion methods--converting in-house, contracting to a vendor, and a combination of the two--and covers the areas of cost, staff, time, and record quality for each. Catalogers will learn how to make a bigger investment in advance planning to achieve better end results. Helpful chapters emphasize the need for planning, quality control, and authority control in the creation of a complete catalog in a machine readable form. Also included are case studies that illustrate specific methods in action and provide a wealth of general, usable information. This unique reference covers a variety of valuable topics for catalogers involved in converting manual catalog records. It includes an in-depth bibliography and review of the retrospective conversion literature, including over 200 items addressing general considerations, special formats, and international issues. Specific examples of retrospective conversion are analyzed including projects in medium and large size institutions, non-serials and serials cataloging, music scores, and the Library of Congress 's conversion of the PREMARC file. Specific techniques are explained such as the development of a PC workstation interface to facilitate the conversion process, the use of sampling techniques in project cost analysis, how to determine what quality standards are needed and at what cost, and authority control in both manual and online catalogs.

The purpose of the project was to identify and define the parameters of an economical and practical information system for the U.S. Army Engineer Research and Development Laboratories. The program included four phases: data requirements definition; cost analysis and system definition; hardware selection, system test and evaluation; and development of software. The method of approach for each

phase is given, and the procedures used and decision criteria developed are discussed. Results of decision to mechanize operations in the information center lead to the selection and installation of four machines, all components of the IBM 870 Document Writing System, within a rental budget of \$7,000 per year. Results of mechanizing, after operation for one year, included: reduced processing costs by rejecting reports having no relevancy to on-going tasks; eliminated the need for overtime required under manual conditions; reduced actual processing costs of documents; reduced processing time per report from 75 days to 5 days; and relieved staff of routine clerical workloads, thereby extending their capacity to optimize other information functions. Cost Accounting

Foreword----- SGML is misunderstood and underestimated. I have always wanted to write this book. I am pleased that two people with whom I have had the pleasure to work were finally able to do so. Since I have always been a bit of an evangelist, I feel pride when my "students" become recognized "teachers". In the early years of SGML we struggled to define a language that would bring the information to its rightful place. We succeeded. Then we had to explain these idea to technical adoptors. Again, I think we have succeeded. We have learned much about SGML in the process of implementing it. These experiences must now also be shared, along with comprehensible information on the lan guage itself. The word must move out of the lab and the computer center and reach the business people, the users, the movers and shakers. The next generation will do things with SGML that we can't even imagine yet- it is that versatile.
