Maple User Manual Storey Publishing

This is a fully revised edition of the best-selling Introduction to Maple. The book presents the modern computer algebra system Maple, teaching the reader not only what can be done by Maple, but also how and why it can be done. The book also provides the necessary background for those who want the most of Maple or want to extend its built-in knowledge. Emphasis is on understanding the Maple system more than on factual knowledge of built-in possibilities. To this end, the book contains both elementary and more sophisticated examples as well as many exercises. The typical reader should have a background in mathematics at the intermediate level. Andre Heck began developing

and teaching Maple courses at the University of Nijmegen in 1987. In 1989 he was appointed managing director of the CAN Expertise Center in Amsterdam. CAN, Computer Algebra in the Netherlands, stimulates and coordinates the use of computer algebra in education and research. In 1996 the CAN Expertise Center was integrated into the Faculty of Science at the University of Amsterdam, into what became the AMSTEL Institute. The institute program focuses on the innovation of computer activities in mathematics and science education on all levels of education. The author is actively involved in the research and development aimed at the integrated computer learning environment Coach for mathematics and science education at secondary school level. The design and implementation of the Maple system is an on-going project of the Symbolic Com putation Group at the University of Waterloo in Ontario, Canada. This manual corresponds with version V (roman numeral five) of the Maple system. The on-line help subsystem can be invoked from within a Maple session to view documentation on specific topics. In particular, the command ?updates points the user to documentation updates for each new version of Maple. The Maple project was first conceived in the autumn of 1980

growing out of discussions on the state of symbolic computation at the University of Waterloo. The authors wish to acknowledge many fruitful discussions with colleagues at the University of Waterloo, particularly Morven Gen tleman, Michael Malcolm, and Frank Tompa. It was recognized in these discussions that none of the locally-available systems for symbolic computation provided the facilities that should be expected for symbolic computation in modern computing environments. We concluded that since the basic design decisions for the then-current symbolic systems such as ALTRAN, CAMAL, REDUCE, and to design a new system MACSYMA were based on 1960's computing technology, it would be wise from scratch taking advantage of the software engineering technology which had become available since then, as well as drawing from the lessons of experience. Maple's basic features (e. g. elementary data structures, input/output, arithmetic with numbers, and elementary simplification) are coded in a systems programming language for efficiency.

This supplement is intended to teach the reader how to solve Statics problems using Maple. While the manual suggests ways to use Maple to enhance your understanding of statics and teach you efficient computational skills, you should feel free to browse the Maple manual and create your own methods for solving statics problems and for

using Maple. Quality technical documents can be created entirely within maple. This manual is an example of this and demonstrates the software's capability. As a consequence, the input and output for formats presented in this manual are consistent with actual Maple input and output. Explanations are provided for the generation of symbols and operators that do not appear on the standard keyboard. Any input that is executed remains in memory and can be used for future calculations. This Maple manual consists of 11 chapters. The first chapter is a general introduction to Maple that concludes with a sample application and can be studied while reading the first chapter of the accompanying Statics text. This is followed by 10 more chapters where appropriate maple solutions are presented for the sample problems in the text. Chapter 1 - Using Maple Computational Software Numerical Calculation Working with Functions Symbolic Calculations Solving Algebraic Equations Graphs and Plots Applications of Maple to a Statics Problem As well as solutions to sample problems from the main text, this manual also covers the following topics: Maple as a Vector Calculator; Solution of Simultaneous Linear Equations; Using Maple for Other Matrix Calculations; Scalar or Dot Product; Vector or Cross Product Between Two Vectors; Parametric Solutions; Solution of Nonlinear Algebraic Equations; Numerical and Symbolic Integration; Three-Dimensional Scatter Plots; Discontinuity Functions; Cables; Wedges; Belt Friction; Ratio of Tensions vs. the Coefficient of Friction and Contact Angle; Principle Second Moments of Area
