appeared, it was suggested to me to publish the article in a separate form, because, as my friends alleged, so important a subject as Draining would make a popular book. However good the idea, or altering the suggestion, my time was too much occupied with the bringing out of my systematic work, to avail myself of it. Changes, however, have of late been made by the Legislature, which will ere long, as I conceive, necessitate the practice of draining in every part of the kingdom For, I suppose, even

the most ardent promoter of free-trade is not disposed to deny, that the entire abolition of protective duties will place the produce of our own land in a position much more unfavourable than that of the foreigner, by both being brought into direct competition in our own market. Nor, on the other hand, can it be gainsaid by the strictest protectionist of native agriculture, that a very large proportion of the land of this kingdom is still much in want of draining, and that draining is the first and most efficient

step towards exciting the natural, and increasing the acquired fertility of the soil. To compete, therefore, with the foreigner, there exists with the agriculturists of this country the most powerful incentive for increasing the permanent fertility of the soil, if that be practicable; and its practicability is known by the agriculturists themselves to be in their own hands, by pursuing a substantial system of draining. Drainage Manual Thieme  
Excerpt from Practical Farm Drainage: Why, When, and How to Tile Drain  
The following pages are presented to those who are interested in the subject of farm drainage. So short has been the time since the introduction of tile drainage in the prairie States, that farmers have scarcely taken time to acquire the requisite knowledge of the subject before they

have begun actual operations. The drainage practice of the eastern States must be adapted to western soil and surroundings. This requires time and close observation. The object of these few pages is to give, in a concise and plain manner, that which the farmer should know, if he contemplates draining his farm. It is not the intention of the author to say all there is to be said upon the subject, but to say enough to give the farmer an

---

elementary knowledge of why, when, where and how to drain his farm. The practical methods described in these pages have been well tested, and are now in constant use by practical men. It is hoped that the language is sufficiently clear to be understood by all. About the Publisher Forgiven Books publishes hundreds of thousands of rare and classic books. Q Thieme

Written by the world's leading authorities on Dr. Emil Vodder's techniques for Manual Lymph Drainage (MLD), this lavishly illustrated guide provides step-by-step descriptions of how to massage the lymph vessels to stimulate smooth lymphatic flow. Full-color photographs supplement concise text describing the basic anatomy and physiology of the circulatory and lymphatic systems, treatment techniques, and the various types of swelling

caused by lymphedema. The authors discuss indications and contraindications, as well as the ways in which Dr. Vodders method affects different regions of the body. Features: The latest information on complete decongestive therapy (CDT), including coverage of compression therapy, taping, respiratory treatment, and other complementary methods More than 200 color photographs visualize the therapist's grips Each chapter includes numerous tips and plenty of space throughout

Excerpt: ... bat can be laid over it and clay tamped against it in such a way that it will be secure. All cracks that are larger than J inch should be covered with bats. Following this method the drain is finished and secured as the work proceeds from the outlet up grade. When the point for joining a branch is reached, the proper tile with Y branch should be placed in position anc3 the opening covered securely to await the construction of the branch line.

When large tiles are used--9-inch and larger--it will be necessary for the workman to walk in the bottom as he grades, which work must be done with the shovel. The same care should be used in securing the proper grade as above noted. Tile should be laid from the outlet up, the workman standing in the bottom and placing them with his hands. They should be secured in place by clay filling, which should be tamped firmly between the sides of the ditch and the tile. If the clay is so hard that it must be loosened by the pick, the tediousness and expense of the work will be greatly increased. It will be

observed that the tools necessary for this work are few: the line or target for obtaining the grade as given by the survey, a working line 100 feet long, ditching spade, round-pointed shovel, tile-hook, and cleaning scoop of the size required for the tile to be laid. The practice of many ditchers is to lay the tile by hand, walking backward in the ditch in front of the tile as they are laid. But it is wholly practicable, when the ditch is properly prepared at the bottom, to lay the tile with a hook from the surface in a perfectly, satisfactory way where the ditches are only 3 or 4 feet deep. This circular provides a comprehensive and practical guide for the

design of storm drainage systems associated with transportation facilities. Design guidance is provided for the design of storm drainage systems which collect, convey, and discharge stormwater flowing within and along the highway right-of-way. Methods and procedures are given for the hydraulic design of storm drainage systems. Design methods are presented for evaluating rainfall and runoff magnitude, pavement drainage, gutter

flow, inlet design, median and roadside ditch flow, structure design, and storm drain piping. Procedures for the design of detention facilities are also presented, along with an overview of storm water pumping stations and urban water quality practices. This edition presents a major change in the methodology discussed in Chapter 5 for designing channels and in Chapter 7 for calculating energy losses in storm drain access holes.

*Drainage Manual* Microcolumn High-Performance Liquid Chromatography Manual Lymph Drainage (MLD), first introduced in 1936 by Drs. Emil and Estrid Vodder of Denmark, is a procedure which stimulates the lymphatic circulation with slow circular and careful pumping massage movements of the hand and the thumb. The thin lymph vessels run through the body tissue like a drainage system which transports the lymphatic fluid via large collecting vessels, the lymph nodes, on to the blood circulation. Manual Lymph Drainage has especially proven its worth in the case of a congestion of the

lymphatic flow. This is often the result of postoperative abdominal surgery and surgical treatment of breast carcinoma. It is only with this smooth and harmonic form of massage that the lymphatic flow is stimulated in the sensitive lymph capillaries. Painful swelling is removed and healing is encouraged. This volume contains all the subject matter of the basic course and has proven its worth for many years. Hildegard Wittlinger is the director of the Dr. Vodder School in Walchsee, Austria, and has taught the MLD technique throughout the world since 1972.
