"Roland provides a well-balanced overview ... extensively illustrated and with timely coverage of some of the latest theories and research." -Stephen P. Ryder, Editor, Casebook: Jack the Ripper More than a century after he stalked the streets of London's East End, Jack the Ripper continues to exert a macabre fascination on the popular imagination. After scrupulously re-examining official documents of the time, investigative journalist Paul Roland strips away decades of myth and misconceptions to reveal the identity of a brand-new suspect who has never been seriously considered until now. If you are expecting a finger to be pointed at one of the

usual suspects, be prepared to have your assumptions turned on their head. If these crimes were being investigated today, what would the authorities consider to be the vital clues? How would their profilers describe England's first serial killer and who would they be looking to convict? As Roland makes clear in this book, nothing about the Whitechapel murders can be taken at face value.

This collection of solved problems corresponds to the standard topics covered in established undergraduate and graduate courses in Quantum Mechanics. Problems are also included on topics of interest which are often absent in the existing literature. Solutions are presented in considerable detail, to enable students to follow each step. The emphasis is on stressing the principles and methods used, allowing students to master new ways of thinking and problem-solving techniques. The problems themselves are longer than those usually encountered in textbooks and consist of a number of questions based around a central theme, highlighting properties and concepts of interest. For undergraduate and graduate students, as well as those involved in teaching Quantum Mechanics, the book can be used as a supplementary text or as an independent self-study tool.
