“I feel twisted”, “I look crooked in the mirror”, “My problems have been going on for years”, “I have tried every kind of treatment” are commonly heard statements. Whether you have complaints or not, it’s time to look at your body alignment, given that the pelvis and spine are not properly aligned in 80% of us. Think of a car that has an alignment problem! The tires wear differently and the car may wiggle and wobble, eventually causing structural

damage to the frame and steering mechanism. We are not so different. Unwanted stresses caused by malalignment can affect every part of your body. You may feel it, for example, as “low back pain”, a “bursitis”, “tight hamstrings”. This book starts by explaining how your pelvis and spine function when in alignment and what happens when things go wrong. It describes some easy ways to recognize and treat the three most common ways the pelvis goes out of alignment. Then it outlines the “malalignment syndrome” – the typical changes and complaints associated with malalignment

that, unfortunately, often lead to unwarranted investigation, misdiagnosis, and inappropriate and sometimes harmful treatment. After discussing the impact on various sports, it provides a comprehensive treatment approach aimed at achieving and maintaining your alignment making use of appropriate complementary techniques and encouraging your regular participation to achieve lasting results.

The Handbook of Nutrition, Diet and the Eye is the first book to thoroughly address common features and etiological factors in how dietary and nutritional factors affect the eye. The ocular system is perhaps one of the least studied organs in diet and nutrition, yet the consequences of vision loss can be devastating. One of the biggest contributors to complete vision loss in the western hemisphere is diabetes, precipitated by metabolic syndrome. In some developing countries, micronutrient deficiencies are major contributory factors to impaired vision. However, there are a range of ocular defects that have either their origin in nutritional deficiencies or excess or have been shown to respond favorably to nutritional components. The eye from the cornea to the retina may be affected by nutritional components. Effects may be physiological or molecular. This book represents essential reading for nutritionists, dietitians, optometrists, ophthalmologists, opticians, endocrinologists, and other clinicians and researchers interested in eye health and vision in general. - Saves clinicians and researchers time in quickly accessing the very latest details on a broad range of nutrition, ocular health, and disease issues - Provides a common language for nutritionists, nutrition researchers, optometrists, and ophthalmologists to discuss how dietary and nutritional factors, and related diseases and syndromes affect the eye - Preclinical, clinical, and population studies will help

nutritionists, dieticians, and clinicians map out key areas for research and further clinical recommendations

1. 1 Purpose and Plan of This Review This review is focused on

the topography and connections of some of the neuron populations that determine the manual dexterity of the macaque monkey. The populations selected for examination are the following: 1. The corticospinal neuron populations 2. The thalamocortical and corticothalamic neuron populations associated with the sensorimotor cortex 3. The ipsilateral cortical connections of the sensorimotor cortex These neuron populations have been chosen because of their obvious relevance to the directed, intelligent use of the hands, but also because of their anatomical and functional interdependence. Corticospinal neuron populations transmit a complex, orchestrated output from

a number of different regions of cerebral cortex to the neuron populations in every segment of the spinal cord, and this output includes the command information defining the intended manual action. The thalamocortical complex is especially concerned with the transmission and modulation or filtering of (a) visual, tactile, proprioceptive, vestibular, and auditory information to the cerebral cortex and (b) information from the cerebellum, basal ganglia, limbic system, and brain stem which is relevant to sensorimotor behavior. Finally, the extensive ipsilateral cortical connections constitute a major part of the supraspinal circuitry which coordinates the contributions of all

the cortical neuron populations contributing to intelligent sensorimotor behavior and, in particular, transmits the cross talk between those cortical neuron populations which shape and control the dextrous handling of objects within reach.
