A practical handbook on evaluating muscular strength and function, Daniels and Worthingham's **Muscle Testing: Techniques of Manual Examination and Performance Testing, 9th Edition** makes it easy to understand and master procedures in manual muscle testing and performance testing. Clear, illustrated instructions provide a guide to patient positioning, direction of motion, and direction of resistance. In addition to muscle testing of normal individuals and others with weakness or paralysis, this edition includes new coverage of alternative strength tests and performance tests for older adults and others with functional decline (such as the inactive and obese). Written by educators Helen J. Hislop, Dale Avers, and Marybeth Brown, this classic physical therapy reference now features an Evolve companion website with video clips demonstrating key muscle testing techniques. Drawings and arrows along with clear written directions make it easy to understand and perform muscle testing procedures, allowing you to assess deficits in strength, balance, and range of motion. More than 600 illustrations clearly show testing sequences, muscle anatomy, and muscle innervation. Video clips of over 100 muscle tests on the Evolve companion website demonstrate the art and technique of muscle

testing in a clinical setting. Details of muscle anatomy and innervation help in linking muscle topography with function. Helpful Hints and Substitutions boxes provide additional tips and highlight muscle substitutions that may occur during a test to ensure greater accuracy in testing. A constant reference number clearly identifies each muscle in the body, indexed in the Alphabetical List of Muscles by Region as well as in the Ready Reference Anatomy Manual on Evolve, to speed cross-referencing and help you quickly identify any muscle.

"The idea behind this manual was born from the need for a reference that would supply the clinician or student a snapshot view of the basics of manual muscle testing. This book is intended as a simple, user-friendly reference for the experienced clinician or student. The text is organized by body region in a "head-to-toe" format to make it easier and more efficient to locate a specific test. There are also over 200 photographs that illustrate testing in both the antigravity and gravity-minimized positions. Finally, there are four appendices that describe manual muscle testing grading, general procedures for

testing, terminology, and factors that may cause inaccurate muscle testing. It is the hope of the author that the material has been presented in a user-friendly format, making the task of manual muscle testing a bit easier to accomplish in the clinical setting"--Provided by publisher.

"Rating scales are used daily by everyone involved in the management of patients with neurologic disease and in the design and management of neurologic clinical trials. Now there is a single source for the wide range of scales used in specific neurologic diseases and neurorehabilitation. You will refer to this volume constantly! The first edition of the Handbook of Neurologic Rating Scales quickly became an invaluable reference work on the increasing array of scales for measuring neurologic disease. In the brief few years since the first edition the importance of this book has only increased. New Chapters Include Scales On: Generic and general use Pediatric neurology and rehabilitation Peripheral neuropathy and pain Ataxia HIV/AIDS And instruments for diagnosing headaches. Formal measurement of the effects of neurologic disease and of treatment effects, beyond the description of changes on the standard neurologic examination, is a relatively recent development. Controlled clinical trials and outcomes research are at the heart of modern information-based medicine, and neurologic scales are essential tools in clinical trials designed to provide this information. A Resource for Clinical Trials The Handbook of Neurologic Rating Scales provides a resource for clinicians and clinical investigators in the broad field of neurology and neurologic rehabilitation to help them: evaluate the clinical trials literature by providing information on the scales being used evaluate and select appropriate and efficient scales for clinical trials and outcomes research, and provide information that will help them to develop new scales or measures or to improve existing ones. A Resource for Evaluating Disease Status Outcomes research is playing an increasingly important role in clinical management and neurorehabilitation, and these also depend largely on measurement of disease status and change. In this era of managed care, neurologists must produce outcomes data demonstrating the effectiveness of neurologic care if the specialty is to survive, and certainly if it is to thrive. Even effective therapies are likely to fall by the wayside if studies to prove their effectiveness are not done. Comprehensive and Standardized Information on All Scales Each chapter in this volume contains the scales of importance and in current use, including a sequence of scale descriptions and specific scales in a standard format, as well as a summary and recommendations indicating which scales are most useful for specific purposes and whether a combination of scales is particularly useful or if better scales are needed. Each entry notes: the purpose for which the scale was developed and its current uses if they differ from those for which it was developed a detailed description of the scale information about validation, such as: Does the scale have face validity? i.e., does it appear to measure what it purports to measure? how and by whom the scale is administered the time needed to administer and score the scale the scale

itself or, when the scale is proprietary or too long for inclusion, a description and key references special considerations, including unusual measures needed to obtain a valid score or problems in administering the test in specific patients advantages, or what makes the scale good or useful. Disadvantages, or what makes the scale difficult to use or impairs its reliability key references, including the original publication of the scale and its validation Downloadable PDFs of the scales contained in the Handbook of Neurologic Rating Scales are included with the purchase of this book. The password to download the files can be found in the book itself.

**Abstract:** BACKGROUND AND PURPOSE: Manual muscle testing is the most commonly used procedure to assess patient strength. The purpose of this study was to determine the consistency in which physical therapists assign manual muscle testing grades. **SUBJECTS:** The subjects were 38 volunteer physical therapists from various clinical settings. All subjects had at least two years of clinical experience. **METHODS AND MATERIALS:** Subjects were instructed to apply either minimum, moderate, or maximum pressure which corresponded to assigning a grade of fair plus, good, or normal according to the Kendall system, respectively. The pressure was applied through the Nicholas Manual Muscle Tester to the right hip flexor muscle group of the researcher. A retest was performed approximately two weeks following the initial test. **STATISTICAL ANALYSES:** The absolute value of the difference between the initial test and retest was used to compare consistency of each subject. Paired samples t-tests were used to test for differences from the initial test to retest for each force level. A 2 X 3 repeated measures analysis of variance (ANOVA) was used to compare force means among force levels and between test days. The standard error of the measure (SEM) was calculated to estimate the precision of measurement made by

examiners at each force level and test day. RESULTS: No significant difference was found between the initial test and retest for any of the force levels. Inconsistencies were found between the initial test and retest for each subject at each force level. Inconsistencies in the amount of applied pressure were found between subjects at each force level. Subjects were found to be the most inconsistent when applying maximum pressure. CONCLUSION: Clinicians were unable to reproduce the same force from initial test to retest. Clinicians also varied in the amount of pressure they perceived as minimum, moderate, and maximum. RELEVANCE: Inconsistencies in assigning grades exist; therefore, manual muscle testing may not be the most clinically useful measurement of strength.

Harvey provides an innovative 5-step approach to the physiotherapy management of people with spinal cord injury. Based on the International Classification of Functioning, this approach emphasises the importance of setting goals which are purposeful and meaningful to the patient. These goals are related to performance of motor tasks analysed in terms of 6 key impairments. The assessment and treatment performance of each of these impairments for people with spinal cord injury is described in the following chapters: training motor tasks strength training contracture management pain management respiratory management cardiovascular fitness training Dr Harvey develops readers' problem-solving skills equipping them to manage all types of spinal cord injuries. Central to these skills is an understanding of how people with different patterns of paralysis perform motor tasks and the importance of different muscles for motor tasks such as: transfers and bed mobility of people wheelchair mobility hand function for people with tetraplegia standing and walking with lower limb paralysis This book is for students and junior physiotherapists with little or no experience in the area of spinal cord injury but with a general understanding of the principles of physiotherapy. It is also a useful tool for experienced clinicians, including those keen to explore the evidence base that supports different physiotherapy interventions.
