Branding is currently one of the most exciting subjects around; business people everywhere are waking up to the fact that brands are a huge source of value. But it is only by understanding the real value that brands bring to consumers that brand owners and manufacturers can truly learn to exploit that value.

Brands no longer operate only in the traditional packaged goods markets; the techniques of good branding are just as vital in the business-to-business and utilities sectors, and are increasingly being applied even in non-commercial areas, from charities to football clubs. This comprehensive and authoritative book looks at branding from a wide range of perspectives: from the creation of a new brand, through the development of brand names and packaging designs, to advertising international brands. It explores the hot topics of brand valuation and brand licensing, as well as studying the increasingly important role of the corporate brand. This book is a must for anyone with an interest in brands.

Porting heads is an art and science. It takes a craftsman's touch to shape the surfaces of the head for the optimal flow characteristics and the best performance. Porting demands the right tools, skills, and application of knowledge. Few other engine builders have the same level of knowledge and skill porting engine heads as David Vizard. All the aspects of porting stock as well as aftermarket heads in aluminum and cast-iron constructions are covered. Vizard goes into great depth and detail on porting aftermarket heads. Starting with the basic techniques up to more advanced techniques, you are shown how to port iron and aluminum heads as well as benefits of hand and CNC porting. You are also shown how to build a high-quality flow bench at home so you can test your work and obtain professional results. Vizard shows how to optimize flow paths through the heads, past the valves, and into the combustion chamber. The book covers blending the bowls, a basic porting procedure, and also covers pocket porting, porting the intake runners, and many advanced procedures. These advanced procedures include unshrouding valves, porting a shortside turn from the floor of the port down toward the valve seat, and developing the ideal port area and angle. All of these changes combine to produce optimal flow velocity through the engine for maximum power.
