With the subtitle of Cellphone, Cameraphone, iPhone, Smartphone, Tomi's latest book takes readers to a journey of the most advanced content and media services deployed on mobile phones in the most advanced mobile telecoms countries such as Japan, South Korea, HongKong, Finland etc. He goes through the taxonomy of the seven massmedia, with an emphasis of what lessons can be learned when newer media were introduced. These lessons he applies now to the 7th media, mobile, with compelling arguments for why just copying television, newspaper or internet content to mobile is not enough. The book starts by setting the stage by examining the overall industry and the consumers of mobile content in four chapters. Next Tomi devotes two chapters into explaining how to build compelling content to mobile, and exploding the myths of the limitations of supposedly too small keypad and tiny screen. In the book he then devotes a chapter each to the most promising early media content types: music, gaming, TV, internet, advertising and social networking. Tomi explains what works and what doesn't when deploying content to the mobile. He also includes a chapter on SMS text messaging. In the book Tomi expands his 5 M's mobile service theory to 6 M's.

He discusses the seven unique benefits of mobile as a mass media channel, and he discusses how mobile phones have evolved through the 8 C's. He concludes the book with essays on related matters such as disruptive factors now creating new opportunities, and a chapter on discussing why the American industry lags the rest of the world in mobile telecoms. Like Tomi's previous books with us (Communities Dominate Brands, co-authored with Alan Moore and Digital Korea, co-authored with Jim O'Reilly) Mobile as 7th of the Mass Media is also a hardcover book, which runs 322 pages and is packed with 16 case studies, up-to-the-minute statistics, end-user analysis, and real world examples. The book is in production and will be available in bookstores soon. We are currently taking pre-orders for the book. We also will sell this book in bulk orders at a discount for those who may consider it as a corporate gift for example or for in-house use. In international comparisons the Nordic countries tend to stand out as major producers and users of information and communication technology (ICT), especially in the field of mobile telecommunications. There is a common understanding the Nordic

countries were particularly well-placed to enter the booming telecommunications industry of the 1980s due to a combination of advanced demand, institutional and societal set-ups that characterize these countries. But this e-book suggests that the technological and business setting of the Nordic mobile communications is undergoing fundamental changes with.

Journalism Design is about the future of journalism. As technologies increasingly, and continually, reshape the way we interact with information, with each other and with our environment, journalists need new ways to tell stories. Journalists often see technology as something that improves what they are doing or that makes it more convenient. However, the growing might of technology companies has put journalism and news organisations in a difficult position: readers and revenues have moved, and platforms exert increasing control over story design. Skye Doherty argues that, rather than adapting journalism to new technologies, journalists should be creating the technologies themselves and those technologies should be designed for core values such as the public interest. Drawing from theories and practices of interaction design, this book demonstrates how journalists can use their expertise to imagine new ways of doing journalism. The design and development of the NewsCube, a three-dimensional

storytelling tool, is detailed, as well as how interaction design can be used to imagine new forms of journalism. The book concludes by calling for closer ties between researchers and working journalists and suggests that journalism has a hybrid future - in newsrooms, communities, design studios and tech companies.

*Mobile Multimedia in Action* John Wiley & Sons The current Symbian Press list focuses very much on the small scale features of Symbian OS in a programming context. The Architecture Sourcebook is different. It's not a how-to book, it's a 'what and why' book. And because it names names as it unwinds the design decisions which have shaped the OS, it is also a 'who' book. It will show where the OS came from, how it has evolved to be what it is, and provide a simple model for understanding what it is, how it is put together, and how to interface to it and work with it. It will also show why design decision were made, and will bring those decisions to life in the words of Symbian's key architects and developers, giving an insider feel to the book as it weaves the "inside story" around the architectural presentation. The book will describe the OS architecture in terms of the Symbian system model. It will show how the model breaks down the system into parts, what role the parts play in the system, how the parts are architected, what motivates their design, and how the design has evolved through the different releases of the system. Key system concepts will be described; design patterns will be explored and related to those from other operating systems. The unique features of Symbian OS will be highlighted and their motivation and evolution traced and

described. The book will include a substantial reference section itemising the OS and its toolkit at component level and providing a reference entry for each component.

Machining is one of the most important manufacturing processes. Parts manufactured by other processes often require further operations before the product is ready for application. "Machining: Fundamentals and Recent Advances" is divided into two parts. Part I explains the fundamentals of machining, with special emphasis on three important aspects: mechanics of machining, tools, and work-piece integrity. Part II is dedicated to recent advances in machining, including: machining of hard materials, machining of metal matrix composites, drilling polymeric matrix composites, ecological machining (minimal quantity of lubrication), high-speed machining (sculptured surfaces), grinding technology and new grinding wheels, micro- and nano-machining, non-traditional machining processes, and intelligent machining (computational methods and optimization). Advanced students, researchers and professionals interested or involved in modern manufacturing engineering will find the book a useful reference.
