Self-Publishing 3.0 is a concept and a publishing era defined by the concept: that any author (with the requisite skills) now has the means to establish a sustainable and scalable business. It is also a campaign from the Alliance of Independent Authors (#selfpub3.0) that works with authors, readers, literary organizations, and creative industries to support independent authors in acquiring the three necessary skills: writing, publishing and creative business. The Self-Publishing 3.0 era, the era of author enterprise, began around 2018. In this era, writers are moving beyond exclusively signing all rights to a single 3rd-party publisher, or exclusively self-publishing with one platform or service, into true creative and commercial independence. This short book outlines both the concept and campaign and aims to explain to self-publishing authors why Self-Publishing 3.0 is important, the tools and techniques driving this trend, and how to take part in this movement that is enabling authors in more number than ever before to earn a living from writing and publishing books.

Bioinformatics is an integrative field of computer science, genetics, genomics, proteomics, and statistics, which has undoubtedly revolutionized the study of biology and medicine in past decades. It mainly assists in modeling, predicting and interpreting large multidimensional biological data by utilizing advanced computational methods. Despite its enormous potential, bioinformatics is not widely integrated into the academic curriculum as most life science students and researchers are still not equipped with the necessary knowledge to take advantage of this powerful tool. Hence, the primary purpose of our book is to supplement this unmet need by providing an easily accessible platform for students and researchers starting their career in life sciences. This book aims to avoid sophisticated computational algorithms and programming. Instead, it focuses on simple DIY analysis and interpretation of biological data with personal computers. Our belief is that once the beginners acquire these basic skillsets, they will be able to handle most of the bioinformatics tools for their research work and to better understand their experimental outcomes. Our second title of this volume set In Silico Life Sciences: Medicine provides hands-on experience in analyzing high throughput molecular data for the diagnosis, prognosis, and treatment of monogenic or polygenic human diseases. The key concepts in this volume include risk factor assessment, genetic tests and result interpretation, personalized medicine, and drug discovery. This volume is expected to train readers in both single and multi-dimensional biological analysis using open data sets, and provides a unique learning experience through clinical scenarios and case studies.
