The differential equation can be written as Integrating $y' + p(x)y = q(x)$.
Multiplying both sides of the equation, we obtain
Integrating both sides, we obtain
Therefore, $y = e^{-\int p(x) dx} \left(\int q(x) e^{\int p(x) dx} dx + C \right)$
Observe that the solution is defined as long as $e^{\int p(x) dx}$ is not zero.
Furthermore, for and Hence $y = e^{-\int p(x) dx} \left(\int q(x) e^{\int p(x) dx} dx + C \right)$...

Unlike most texts in differential equations, this textbook
gives an early presentation of the Laplace transform,
which is then used to motivate and develop many of the
remaining differential equation concepts for which it is
particularly well suited. For example, the standard

For example, the standard solution methods for constant
coefficient linear differential equations are immediate and
simplified, and solution methods for constant coefficient
systems are streamlined. By introducing the Laplace transform
early in the text, students become proficient in its use while at
the same time learning the standard topics in differential
equations.
