This manual and the free downloadable costing tool is the outcome of a project identified by the Water, Sanitation and Health Programme (WSH) of the World Health Organization (WHO) faced with the challenge of costing options for improved access, both to safe drinking water and to adequate sanitation.

Although limited in scope to the process of costing safe water supply technologies, a proper use of this material lies within a larger setting considering the cultural, environmental, institutional, political and social conditions that should be used by policy decision makers in developing countries to promote sustainable development strategies. Costing Improved Water Supply Systems for

Low-income Communities

provides practical guidance to facilitate and standardize the implementation of social life-cycle costing to “improved” drinking-water supply technologies. These technologies have been defined by the WHO/UNICEF Joint Monitoring Programme for Water Supply and Sanitation, as those that, by the nature of its construction, adequately protect the source of water from outside contamination, in particular with faecal matter. The conceptual framework used has also been conceived to be applied to costing improved sanitation options. To facilitate the application of the costing method to actual projects, a basic tool was developed using Microsoft Excel, which is called a water supply costing

processor. It enables a user-friendly implementation of all the tasks involved in a social life-cycle costing process and provides both the detailed and the consolidated cost figures that are needed by decision-makers. The scope and the limits of the costing method in a real setting was assessed through field tests designed and performed by local practitioners in selected countries. These tests were carried out in Peru and in six countries in the WHO regions of South-East Asia and the Western Pacific. They identified practical issues in using the manual and the water supply costing processor and provided practical recommendations. References and Glossary

Approaches give the village communities the power to choose which type of technology they want for their water supply facilities. They are also responsible for the management of the systems and have to take into consideration costs for operation, maintenance and major repairs as well as the reliability. To arrive at a sensible choice it is necessary that the communities are aware of the technical, financial and institutional implications of their technology choice. This book gives information on the different technology options for pumping water (point sources or piped systems) in an easy-to-read format. It lists possible managerial models for provision of services and O&M through the private sector.

Ludwig holds the last cords as the music totally dies out. Nobody moves while his hands are still slightly lifted. Finally, he lowers his hands and lets his arms fall down along his body. He stands deeply concentrated with his head bowed. With one hand, he brushes his hair back. He turns to the audience. An enormous applause evolves to standing ovations. Ludwig turns and lifts his arms toward the audience. He turns back to orchestra and again lifts his arms. Finally, he again faces the audience and stands with the orchestra and the singers behind him. He smiles and almost laughs, totally delighted as though he cannot believe the achievement. The musicians zap their instruments as their standing applause. Ludwig again lifts his arms and embraces the audience. He bows deeply.

He turns around and walks between the musicians toward the door to the concert corridor leaving the undiminished applause behind. The singers follow him.

Efficient and effective irrigation of the land can have a dramatic effect on the agricultural output and the economic well-being of a community. At the heart of effective irrigation lies the problem of lifting or pumping water, and this handbook surveys the water-lifting technologies that are available and appropriate for smallholdings. It is a detailed and practical review of the options, especially for irrigation but also for other purposes, and the costs and general suitability of the different technologies are examined with the aim of

enabling farmers and policymakers to make informed choices. This is an updated and expanded new edition of a book formerly called 'Water Pumping Devices'.
