Conceived during the dark days of the Cold War, the U-2 is a single-engine, single-seat, surveillance aircraft. Designed by aeronautical engineer ζ Kelly ζ Johnson, the plane was used by the C.I.A. to photograph installations deep inside Soviet Russia. Known as the ζ Dragon Lady ζ, the U-2 was classified. Its existence remained a secret until 1960, when a U-2 flown by Francis Gary Powers was shot down over Soviet territory. The U-2 went on to have a long and illustrious career. Upgraded airframes remained in use five decades after it first debuted. Originally printed by Lockheed and the U.S. Air Force in the 1960s, this Flight Operating Handbook taught pilots everything they needed to know before entering the cockpit. Classified ζ Restricted ζ, the manual was recently declassified and is here reprinted in book form. This affordable facsimile has been slightly reformatted. Care has been taken however to preserve the integrity of the text.

Extracorporeal membrane oxygenation (ECMO) has been in clinical use for some 40 years, but it is only in the past decade that its application in the treatment of life-threatening circulatory and respiratory failure has truly flourished. This book presents a comprehensive overview of both pathophysiological and practical aspects of circulatory and respiratory extracorporeal support. The basics of ECMO, including its history, the “ECMO team”, cannulation, materials, and blood-surface interactions, are first discussed. The various indications for and particular characteristics of circulatory and respiratory extracorporeal life support are then described in detail in the main part of the book. Patient care during ECMO and monitoring of the ECMO patient are also carefully covered, with explanation of the management of technical and clinical complications and transport-related problems. Further topics include long-term therapy options beyond ECMO, such as ventricular assist devices and transplants, outcome, the new frontiers of ECMO for organ procurement and future challenges. The authors are well-known experts in the field whose authoritative contributions and attention to practical aspects will be invaluable for novices and experienced practitioners alike.

Combining vivid personal narrative with historical and operational analyses, this book takes a candid look at U.S. naval airpower in the Vietnam War. Coauthors John Nichols, a fighter pilot in the war, and Barrett Tillman, an award-winning aviation historian, make full use of their extensive knowledge of the subject to detail the ways in which airpower was employed in the years prior to the fall of Saigon. Confronting the conventional belief that airpower failed in Vietnam, they show that when applied correctly, airpower was effective, but because it was often misunderstood and misapplied, the end results were catastrophic. Their book offers a compelling view of what it was like to fly from Yankee Station between 1964 and 1973 and important lessons for future conflicts. At the same time, it adds important facts to the permanent war record. Following an analysis of the state of carrier aviation in 1964 and a definition of the rules of engagement, it describes the tactics used in strike warfare, the airborne and surface threats, electronic countermeasures, and search and rescue. It also examines the influence of political decisions on the conduct of the war and the changing nature of the Communist opposition. Appendixes provide useful statistical data on carrier deployments, combat sorties, and aircraft losses.

For Stirling engines to enjoy widespread application and acceptance, not only must the fundamental operation of such engines be widely understood, but the requisite analytic tools for the stimulation, design, evaluation and optimization of Stirling engine hardware must be readily available. The purpose of this design manual is to provide an introduction to Stirling cycle heat engines, to organize and identify the available Stirling engine literature, and to identify, organize, evaluate and, in so far as possible, compare non-proprietary Stirling engine design methodologies. This report was originally prepared for the National Aeronautics and Space Administration and the U. S. Department of Energy.

Environmental pollution is a concern of many people in Egypt and the world in general. People and Pollution is a study of how Egyptians in particular understand environmental problems and what their roles are in the solutions. This original study is based on extensive field research with both academic and policy relevance. The uniqueness of the book comes from its focus: instead of the usual approach of analyzing policy and measurements, this text seeks to understand how the people themselves, often the objects of policy, understand their environment and their own actions. An interesting finding from the research lies in the focus of Egyptian concerns. Rather than the global perspective (the depletion of the ozone layer, protection of coral reefs and rainforests, and so on) that is common in the West, Egyptians are mainly concerned with matters of immediate environmental degradation, such as garbage, sewage, dirty streets, and noise pollution. In addition, the researchers have found that people are often able to effect changes themselves through cooperation with neighbors, thus bypassing the 'official' channels of redress such as NGOs and local government officials. The difference in focus of concern and courses of action may be extrapolated to many Third World or developing

nations, and leads to provocative questions regarding policymaking for public participation in future environmental campaigns. Descriptive views from the authors, eloquent and moving testimony from members of the community, and clear statistical analysis of the findings make this book a highly readable text. People and Pollution is a pioneering and important work that should be consulted by environmentally concerned readers, students, and policymakers alike.

Once in a while the world astonishes itself. Anxious incredulity replaces intellectual torpor and a puzzled public strains its antennae in every possible direction, desperately seeking explanations for the causes and nature of what just hit it. 2008 was such a moment. Not only did the financial system collapse, and send the real economy into a tailspin, but it also revealed the great gulf separating economics from a very real capitalism. Modern Political Economics has a single aim: To help readers make sense of how 2008 came about and what the post-2008 world has in store. The book is divided into two parts. The first part delves into every major economic theory, from Aristotle to the present, with a determination to discover clues of what went wrong in 2008. The main finding is that all economic theory is inherently flawed. Any system of ideas whose purpose is to describe capitalism in mathematical or engineering terms leads to inevitable logical inconsistency; an inherent error that stands between us and a decent grasp of capitalist reality. The only scientific truth about capitalism is its radical indeterminacy, a condition which makes it impossible to use science's tools (e.g. calculus and statistics) to second-guess it. The second part casts an attentive eye on the post-war era; on the breeding ground of the Crash of 2008. It distinguishes between two major post-war phases: The Global Plan (1947-1971) and the Global Minotaur (1971-2008). This dynamic new book delves into every major economic theory and maps out meticulously the trajectory that global capitalism followed from post-war almost centrally planned stability, to designed disintegration in the 1970s, to an intentional magnification of unsustainable imbalances in the 1980s and, finally, to the most spectacular privatisation of money in the 1990s and beyond. Modern Political Economics is essential reading for Economics students and anyone seeking a better understanding of the 2008 economic crash.
