Characterization John Wiley & Sons
This book emphasises the relationships between diverse types of material, and their importance and usage in engineering. It describes the structure property processing

performance relationships in various classes - metals, ceramics, polymers and composites. Each chapter discusses all these materials, so that students are reminded of bonding and structure and their influence on properties, processing and material performance. Within this core content the authors have inserted numerous illustrations and worked examples, case studies, and questions at the end of each chapter, in order to encourage the reader to better understand and appreciate the subject. This title will serve as an excellent textbook for engineering students of diverse disciplines, as well as an introduction for design engineers in manufacturing industries engaged in the selection of engineering materials.

Materials Science And Engineering: An Introduction, 6Th Ed (W/Cd) Wiley

Building on the success of previous editions, this book continues to provide engineers with a strong understanding of the three primary types of materials and composites, as well as the relationships that exist between the structural elements of materials and their properties. The relationships among processing, structure, properties, and performance components for steels, glass-ceramics, polymer fibers, and silicon semiconductors are explored throughout the chapters. The discussion of the construction of crystallographic directions in hexagonal unit cells is expanded. At the end of each chapter, engineers will also find revised summaries and new equation summaries to reexamine key concepts.
