Surface engineering is the sub-discipline of materials science which deals with the surface of solid matter. It has applications to chemistry, mechanical engineering, and electrical engineering. Solids are composed of a bulk material covered by a surface. The surface which bounds the bulk material is called the Surface phase. It acts as an interface to the surrounding environment. The bulk material in a solid is called the Bulk phase. The surface phase of a solid interacts with the surrounding e

Materials Design and Surface Engineering. The first interaction of the environment with a material occurs at the surface, irrespective of whether this interaction is mechanical, chemical or biological. Improvement of materials performance with respect to corrosion, wear and fatigue is often realized by modifying the surface level.

Advanced surfaces enriches the high-throughput engineering of physical and chemical phenomenon in relation to electrical, magnetic, electronics, thermal and optical controls, as well as large surface areas, protective coatings against water loss and excessive gas exchange.
