Mathematical logic is a subfield of mathematics exploring the applications of formal logic to mathematics. It bears close connections to metamathematics, the foundations of mathematics, and theoretical computer science. The unifying themes in mathematical logic include the study of the expressive power of formal systems and the deductive power of formal proof systems. Mathematical logic is often divided into the fields of set theory, model theory, recursion theory, and proof theory. These areas

CHAPTER 1 BASIC CONCEPTS TYPES OF LOGIC

Logic is primarily concerned with distinguishing correct reasoning from reasoning that is incorrect. It is most closely related to rhetoric which also deals with the reasoning process.

Characteristics of Logical-Mathematical Learners

Gödel's Incompleteness Theorem gave this program a severe setback, but the view that logic is the handmaiden to mathematical proof continues to thrive (to some extent, for example, in Bell et al. [Bell+DeVidi+Solomon2001-lo]). The main thrust of logic, however, shifted to computability and related concepts, models and semantic structures, expressiveness, extensions of classical logic for other situations, and the study of logical systems as subjects of interest in their own right.

Discrete Mathematics - Propositional Logic - Tutorialspoint

This chapter discusses the most elementary branch of mathematical logic, that is, the sentential logic or the propositional calculus. This branch of logic has to do with the logical properties of the various forms of sentential composition, by means of which sentences are joined together to result in compound sentences.
