NEW YORK TIMES BESTSELLER • A former Wall Street quant sounds the alarm on Big Data and the

mathematical models that threaten to rip apart our social fabric—with a new afterword “A manual for the twenty-first-century citizen . . . relevant and urgent.”—Financial Times **NATIONAL BOOK AWARD LONGLIST** • **NAMED ONE OF THE BEST BOOKS OF THE YEAR BY** The New York Times Book Review • The Boston Globe • Wired • Fortune • Kirkus Reviews • The Guardian • Nature • On Point

We live in the age of the algorithm. Increasingly, the decisions that affect our lives—where we go to school, whether we can get

a job or a loan, how much we pay for health insurance—being made not by humans, but by machines. In theory, this should lead to greater fairness: Everyone is judged according to the same rules. But as mathematician and data scientist Cathy O’Neil reveals, the mathematical models being used today are unregulated and uncontestable, even when they’re wrong. Most troubling, they reinforce discrimination—propping up the lucky, punishing the downtrodden, and undermining our democracy in the process. Welcome to the

The fundamental
mathematical tools
needed to understand
machine learning
include linear
algebra, analytic
geometry, matrix
decompositions,
vector calculus,
optimization,
probability and
statistics. These
topics are
traditionally taught in
disparate courses,
making it hard for
data science or
computer science
students, or

professionals, to
efficiently learn the
mathematics. This self-
contained textbook
bridges the gap
between mathematical
and machine learning
texts, introducing the
mathematical
concepts with a
minimum of
prerequisites. It uses
these concepts to
derive four central
machine learning
methods: linear
regression, principal
component analysis,
Gaussian mixture
models and support
vector machines. For
students and others
with a mathematical
background, these
derivations provide a
starting point to
machine learning
texts. For those
learning the
mathematics for the
first time, the methods
help build intuition
and practical

experience with applying mathematical concepts. Every chapter includes worked examples and exercises to test understanding.

Programming tutorials are offered on the book's web site.

The expert contributors to this volume tell how state laws and policies have stacked the deck against charter schools by limiting the number of charter schools allowed in a state, forbidding for-profit firms from holding

charters, forcing them to pay rent out of operating funds, and other ways. They explain how these policies can be amended to level the playing field and give charter schools—and the children they serve—a fairer chance to succeed.

Adheres to Canadian Curriculum! This Mastering Math book is a complete, condensed course of instruction or review for Grade Four Mathematics. It is 100% Canadian content following the elementary mathematics

curriculum guidelines. Each Mastering Math book is organized according to these five general curriculum threads: Number Sense & Numeration, Measurement, Geometry & Spatial Sense, Patterning & Algebra, and Data Management & Probability. Each topic area contains individual skills and concepts that match the learning expectations of the curriculum. Mastering Math can be used to support the standard classroom curriculum as every learning expectation in the year's curriculum is included. Mastering Math is also an excellent framework for reviewing the full curriculum at home for students who need extra practise. 97

languages we use today. It then explores the realm of “atypical” programming languages, introducing you to the out-of-the-box thinking that comes from these unusual approaches to coding. Later chapters address the even more unusual esolangs, nearly all of which are like nothing you’ve ever seen. Finally, author Ron Kneusel helps you develop and use two entirely new programming languages. You may not apply these languages in your day job, but

this one-of-a-kind book will motivate you to think differently about what it means to express thought through code, while discovering the far-flung boundaries of programming. You’ll learn: How to program with pictures using Piet How to write two-dimensional programs in Befunge How to implement machine-learning algorithms using the text pattern matching language SNOBOL How to decipher Brainfuck code like [->-[>+] >[[+]+>+]”““/lili How to design and

create two original programming languages Learning to think in these languages will make you a better, more confident programmer. **Computerworld** Oxford University Press Real-World Lessons + Excellent Support Whatever you do in business, you will experience MIS.
