Analysis of the motion of the planets and their orbits around the sun raises an interesting possibility for the theory of General Relativity. A simple spreadsheet model is presented which examines various factors that could influence the orbits of the planets. It appears that variations in the speed of light could play an important role in determining the time taken for the planets to orbit the sun.

Although the Jet Propulsion Laboratory in Pasadena, California, has become synonymous with the United States' planetary exploration during the past half century, its most recent focus has been on Mars. Beginning in the 1990s and continuing through the Mars Phoenix mission of 2007, JPL led the way in engineering an impressive, rapidly evolving succession of Mars orbiters and landers, including roving robotic vehicles whose successful deployment onto the Martian surface posed some of the most complicated technical problems in space flight history. In Exploration and Engineering, Erik M. Conway reveals how JPL engineers' creative technological feats led to major breakthroughs in Mars exploration. He takes readers into the heart of the lab's problem-solving approach and management structure, where talented scientists grappled with technical challenges while also coping, not always successfully, with funding shortfalls, unrealistic schedules, and managerial turmoil. Conway, JPL's historian, offers an insider's perspective into the changing goals of Mars exploration,

the ways in which sophisticated computer simulations drove the design process, and the remarkable evolution of landing technologies over a thirty-year period. "A masterpiece of research and writing."—Quest: History of Spaceflight Quarterly "A 'must' for any reader of modern astronomy who wants insights into how the lab conducts its research, solves problems, and handle[s] technological challenges."—Midwest Book Review "A great tale of ambition, mishap and recovery, building on extensive archival research and interviews with JPL managers, scientists and engineers, to deliver a detailed overview of each mission's feats and failures . . . Exploration and Engineering is a great book for everyone seriously interested in the struggles and achievements of JPL as NASA's centre for Mars exploration."—Sky at Night Erik M. Conway is a historian of science and technology at the Jet Propulsion Laboratory, California Institute of Technology. He is the author of Atmospheric Science at NASA: A History.

DIE REIHE: LITERATUR- UND NATURWISSENSCHAFTEN entsteht unter Federführung des Erlanger Forschungszentrums für Literatur- und Naturwissenschaften (ELINAS). Experten unterschiedlicher Fachkulturen führen darin ihre Methoden zusammen und fragen sowohl nach den Funktionen der Sprache in der naturwissenschaftlichen Forschung als auch nach den Verfahren der Modellierung naturwissenschaftlicher Erkenntnisse in der Literatur. Die Reihe versteht sich als ein interdisziplinäres Forum zur Reflexion der kulturellen Bedeutung natur- und literaturwissenschaftlicher Forschung sowie zur Ethik und Rhetorik wissenschaftlicher Argumentation.

Meru is referred to, talked about, heard of, compared to, and discussed about without exception in all books and discourses of religions in Bharat. Meru is regarded as the tallest and most pious mountain, having abodes of all Gods and Semi-Gods of all faiths. Unfortunately, nobody can confidently pinpoint the place of Meru in spite of indicative addresses available in scriptures. Generally, Hindus believe it to be beyond Himalayas; Buddhists say it is in Tibet; Jains say it exists, but it cannot be seen. This is because of unsatisfactory solutions to its conflicting descriptions. For example, the Sun never sets on Meru but does set at the base of it. In this book, satisfactory solutions have been explained with convincing reasons. Establishing Meru on the equator at "Bhugol Madhye," the author ventures to replace Greenwich Mean Time (GMT) with Meru Mean Time (MMT) for the reasons based on his findings. Also, the myth of fourteen Ratnas (Gems) coming out during 'Samudra Manthan'— churning of the ocean has been explained in a lucid manner. Meru no longer remains a matter of miracle, myth or mystery but a history.

Vision is about insight, and visual perception is about cognition - and they form the foundation of how we see the world. Duco A. Schreuder, a physicist and psychologist, explores the finer details of each in this groundbreaking book that explores human consciousness and perception. Sharing virtually everything he's

learned over a varied career spanning more than sixty years, he examines a wide array of topics, including how we understand what we visually process, how we store and retrieve information, the role that neurons play in how what we see, and much more. While Schreuder isn't afraid to disagree with other leading thinkers, he relies on science and focuses on the facts behind it so you can understand lighting, visual perception, engineering design, and applied and experimental physics. Looking is about insight, whereas seeing is about knowledge, and you need to know how each one works to truly understand how humanity views the world. Whether you're an illuminating engineer considering the fundamentals of the trade or a student or professional in an allied discipline, you'll be well served by taking a closer look at Vision and Visual Perception. Yearbook on Space Policy 2014 Petrogav International The Congress "Arsenic in the Environment" offers an international, multi- and interdisciplinary discussion platform for research and innovation aimed towards a holistic solution to the problem posed by the environmental toxin arsenic, with considerable societal impact. The congress has focused on cutting edge and breakthrough research in physical, chemical, toxicological, medical, agricultural and other specific issues on arsenic across a broader environmental realm. The Congress "Arsenic in the Environment" was first organized in Mexico City (As2006) followed by As2008 in Valencia, Spain, As2010 in Tainan, Taiwan, As2012 in Cairns, Australia and As2014 in Buenos Aires, Argentina. The 6th International Congress As2016 was held June 19-23, 2016 in Stockholm, Sweden and was entitled Arsenic Research and Global Sustainability. The Congress addressed the broader context of arsenic research along the following themes: Theme 1: Arsenic in Environmental Matrices and Interactions (Air, Water, Soil and Biological Matrices) Theme 2: Arsenic in Food Chain Theme 3: Arsenic and Health Theme 4: Clean Water Technology for Control of Arsenic Theme 5: Societal issues, Policy Studies, Mitigation and Management Long term exposure to low-to-medium levels of arsenic via contaminated food and drinking water can have a serious impact on human health and globally, more than 100 million people are at risk. Since the end of the 20th century, arsenic in drinking water (mainly groundwater) has emerged as a global health concern. In the past decade, the presence of arsenic in plant foods – especially rice – has gained

increasing attention. In the Nordic countries in particular, the use of water-soluble inorganic arsenic chemicals (e.g. chromated copper arsenate, CCA) as wood preservatives and the mining of sulfidic ores have been flagged as health concern. The issue has been accentuated by discoveries of naturally occurring arsenic in groundwater, primarily in the private wells, in parts of the Fennoscandian Shield and in sedimentary formations, with potentially detrimental effects on public health. Sweden has been at the forefront of research on the health effects of arsenic, technological solutions for arsenic removal, and sustainable mitigation measures for developing countries. Hosting this Congress in Sweden was also relevant because historically Sweden has been one of the leading producer of As_2O_3 and its emission from the smelting industries in northern Sweden and has successfully implemented actions to reduce the industrial emissions of arsenic as well as minimizing the use of materials and products containing arsenic in since 1977. The Congress has gathered professionals involved in different segments of interdisciplinary research in an open forum, and strengthened relations between academia, industry, research laboratories, government agencies and the private sector to share an optimal atmosphere for exchange of knowledge, discoveries and discussions about the problem of arsenic in the environment and catalyze the knowledge generation and innovations at a policy context to achieve the goals for post 2015 Sustainable Development.

How math helps us solve the universe's deepest mysteries
One of the great insights of science is that the universe has an underlying order. The supreme goal of physicists is to understand this order through laws that describe the behavior of the most basic particles and the forces between them. For centuries, we have searched for these laws by studying the results of experiments. Since the 1970s, however, experiments at the world's most powerful atom-smashers have offered few new clues. So some of the world's leading physicists have looked to a different source of insight: modern mathematics. These physicists are sometimes accused of doing 'fairy-tale physics', unrelated to the real world. But in *The Universe Speaks in Numbers*, award-winning science writer and biographer Farmelo argues that the physics they are doing is based squarely on the well-established principles of quantum theory and relativity, and part of a tradition dating back to Isaac Newton. With unprecedented access to some of the world's greatest scientific minds, Farmelo offers a vivid, behind-the-scenes account of the blossoming relationship between mathematics and physics and the research that could revolutionize our understanding of reality. A masterful account of the some of the most groundbreaking ideas in physics in the past four decades. *The Universe Speaks in Numbers* is essential reading for anyone interested in the quest to discover the fundamental laws of nature.

2016 IBPA Benjamin Franklin Silver Award Winner The earth shakes and cracks open. Volcanoes erupt. Continents freeze, bake, and flood. Droughts parch the land. Wildfires and hundred-year storms consume anything in their paths. Invisible clouds of disease and pestilence probe for victims. Tidal waves sweep ashore from the vast sea. The natural world is a dangerous place, but one species has evolved a unique defense against the hazards: civilization. Civilization rearranges nature for human convenience. Clothes and houses keep us warm; agriculture feeds us; medicine fights our diseases. It all works—most of the time. But key resources lie in the most hazardous places, so we choose to live on river flood plains, on the slopes of volcanoes, at the edge of the sea, above seismic faults. We pack ourselves into cities, Petri dishes for germs. Civilization thrives on the edge of disaster. And what happens when natural forces meet molasses holding tanks, insecticides, deepwater oil rigs, nuclear power plants? We learn the hard way how to avoid the last disaster—and maybe how to create the next one. What we don't know can, indeed, hurt us. This book's white-knuckled journey from antiquity to the present leads us to wonder at times how humankind has survived. And yet, as Author Gale Eaton makes clear, civilization has advanced not just in spite of disasters but in part because of them. Hats off to human resilience, ingenuity, and perseverance! They've carried us this far; may they continue to do so into our ever-hazardous future. The History in 50 series explores history by telling thematically linked stories. Each book includes 50 illustrated narrative accounts of people and events—some well-known, others often overlooked—that, together, build a rich connect the-dots mosaic and challenge conventional assumptions about how history unfolds. Dedicated to the premise that history is the greatest story ever told. Includes a mix of “greatest hits” with quirky, surprising, provocative accounts. Challenges readers to think and engage. Includes a glossary of technical terms; sources by chapter; teaching resources as jumping-off points for student research; and endnotes. Over 2,400 total pages ... Russian outrage following the September 2004 hostage disaster at North Ossetia's Beslan Middle School No.1 was reflected in many ways throughout the country. The 52-hour debacle resulted in the death of some 344 civilians, including more than 170 children, in addition to unprecedented losses of elite Russian security forces and the dispatch of most Chechen/allied hostage-takers themselves. It quickly became clear, as well, that Russian authorities had been less than candid about the number of hostages held and the extent to which they were prepared to deal with the situation. Amid grief, calls for retaliation, and demands for reform, one of the more telling reactions in terms of hardening public perspectives appeared in a national poll taken several days after the event. Some 54% of citizens polled specifically judged the Russian security forces and the police to be corrupt and thus complicit in the failure to deal adequately with terrorism, while 44% thought that no lessons for the future would be learned from the tragedy. This pessimism was the consequence not just of the Beslan terrorism, but the accumulation of years of often spectacular failures by Russian special operations forces (SOF, in the apt US military acronym). A series of Russian SOF counterterrorism mishaps, misjudgments, and failures in the 1990s and continuing to the present have made the Kremlin's special operations establishment in 2005 appear much like Russia's old Mir space station—wired together, unpredictable, and subject to sudden, startling failures. But Russia continued to maintain and expand a large, variegated special operations establishment which had borne the brunt of combat actions in Afghanistan, Chechnya, and other trouble spots, and was expected to serve as the nation's principal shield against terrorism in all its forms. Known since Soviet days for tough personnel, personal bravery, demanding training, and a certain rough or brutal competence that not infrequently violated international human rights norms, it was supposed that Russian special operations forces—steeped in their world of “threats to the state” and associated with once-dreaded military and national intelligence services—could make valuable contributions to countering terrorism. The now widely perceived link between “corrupt” special forces on

the one hand, and counterterrorism failures on the other, reflected the further erosion of Russia's national security infrastructure in the eyes of both Russian citizens and international observers. There have been other, more ambiguous, but equally unsettling dimensions of Russian SOF activity as well, that have strong internal and external political aspects. These constitute the continuing assertions from Russian media, the judicial system, and other Federal agencies and officials that past and current members of the SOF establishment have organized to pursue interests other than those publicly declared by the state or allowed under law. This includes especially the alleged intent to punish by assassination those individuals and groups that they believe have betrayed Russia. The murky nature of these alleged activities has formed a backdrop to other problems in the special units.
