For three decades Jeremy Holmes has been a leading figure in psychodynamic psychiatry in the UK and across the world. He has played a central role in promoting the ideas of John Bowlby and in developing the clinical applications – psychiatric and psychotherapeutic – of Attachment Theory in working with adults. Drawing on both psychoanalytic and attachment ideas, Holmes has been able to encompass a truly biopsychosocial perspective. As a psychotherapist Holmes brings together psychodynamic, systemic and cognitive models, alert to vital differences, but also keenly sensitive to overlaps and parallels. This volume of selected papers brings together the astonishing range of Holmes' interests and contributions. The various sections in the book cover: An extended interview – covering Holmes' career and philosophy as a psychodynamic psychiatrist 'Juvenilia' – sibling relationships, the psychology of nuclear weapons, and the psychodynamics of surgical intervention. Psychodynamic psychiatry: Integrative and Attachment-Informed A psychotherapy section in which he develops his model of psychotherapeutic change 'Heroes' – biographical pieces about the major influences including, John Bowlby, Michael Balint, David Malan, Jonathan Pedder and Charles Rycroft. 'Ephemera' – brief pieces covering such topics as frequency of psychodynamic sessions and fees. Attachments: Psychiatry, Psychotherapy, Psychoanalysis - The Selected Works of Jeremy Holmes will be essential and illuminating reading for practitioners and students of psychiatry and psychotherapy in all its guises.

The image on the front cover depicts a carbon nanotube emerging from a glowing plasma of hydrogen and carbon, as it forms around particles of a metal catalyst. Carbon nanotubes are a recently discovered allotrope of carbon. Three other allotropes of carbon- buckyballs, graphite, and diamond-are illustrated at the left, as is the molecule methane, CH₄, from which nanotubes and buckyballs can be made. The element carbon forms an amazing number of compounds with structures that follow from simple methane, found in natural gas, to the complex macromolecules that serve as the basis of life on our planet. The study of chemistry also follows from the simple to the more complex, and the strength of this text is that it enables students with varied backgrounds to proceed together to significant levels of achievement.

Unsaturated materials comprise residua, collapsible and expansive naturally occurring soils, compacted soils and, more recently, residues of solid wastes. The engineering problems associated with unsaturated materials range from those related to conventional geotechnical works (e.g. foundations, pavements, slopes and excavations, retaining structures, earthdams, irrigation canals, tunnelling, compacted embankments) to those included in the environmental area (e.g. natural slope instability, erosion and subsidence processes, tailings, residues or solid waste disposal, contaminant transport, remediation of contaminant sites, engineered barriers for environmental protection, re-use of residues). This book, published in three separate volumes, comprises a selection of selected and invited papers presented at the Third International Conference on Unsaturated Soils – UNSAT '2002 – that took place in Recife, Brazil, from 10th to 13th March 2002. The book is of interest to consultants, researchers, practitioners, lecturers and students with a background in geotechnical engineering, environmental engineering and engineering geology.
